## PRONOUNCING

## DICTIONARY OF MEDICINE.

WITH

Phonetic Pronunciation, Accentuation, Etymology, etc.

BY JOHN M. KEATING, M.D., LL.D.,

Fellow of the College of Physicians of Philadelphia; Vice-President of the American Pædiatric Society; Ex-President of the Association of Life Insurance Medical Directors; Editor "Cyclopædia of the Diseases of Children," etc.;

SURGEON GENERAL'S OFFICE

LIBRARY

MANNEY  
SectionForm 113c No. 292774  
W. D., S. G. O.

GOVERNMENT PRINTING OFFICE

"I am much pleased with Keating's Dictionary, and shall take pleasure in recommending it to my classes." (Signed) HENRY M. LYMAN, M.D.,  
*Professor of Principles and Practice of Medicine, Rush Medical College, Chicago, Ill.*

"I am convinced that it will be a very valuable adjunct to my study table, convenient in size and sufficiently full for ordinary use." (Signed) C. A. LINDSLEY, M.D.,

*Professor of Theory and Practice of Medicine, Medical Dept. Yale University,  
 Secretary Connecticut State Board of Health, New Haven, Connecticut.*

"I will point out to my classes the many good features of this book as compared with others, which will, I am sure, make it very popular with students." (Signed) JOHN CRONYN, M.D., LL.D.,

*Professor of Principles and Practice of Medicine and Clinical Medicine;  
 President of the Faculty, Medical Dept. Niagara University, Buffalo, N. Y.*

"My examination and use of it have given me a very favorable opinion of its merit, and it will give me pleasure to recommend its use to my class." (Signed) J. W. H. LOVEJOY, M.D.,

*Professor of Theory and Practice of Medicine, and President of the Faculty,  
 Medical Dept. Georgetown University, Washington, D. C.*

# SAUNDERS' Pocket Medical Formulary

BY

WILLIAM M. POWELL, M.D.,

Attending Physician to the Mercer House for Invalid Women, at Atlantic City.

CONTAINING

1750 Formulæ, selected from several hundreds of the best known authorities.

Forming a handsome and convenient Pocket Companion of nearly 300 printed pages, and blank leaves for additions.

## WITH AN APPENDIX

Containing Posological Table; Formulæ and Doses for Hypodermic Medication; Poisons and their Antidotes; Diameters of the Female Pelvis and Fœtal Head; Obstetrical Table; Diet List for various diseases; Materials and Drugs used in Antiseptic Surgery; Treatment of Asphyxia from Drowning; Surgical Remembrancer; Tables of Incompatibles; Eruptive Fevers; Weights and Measures, etc.

Second Edition, Revised and greatly Enlarged.

Handsomely bound in Morocco, with Patent Index, Wallet, and Flap.

**Price, \$1.75 net.**

THERAPEUTIC GAZETTE, January, 1892.—“The prescriptions have been taken from the writings or practice of Physicians whose experience qualifies them to be worthy of trial. We heartily recommend this volume to all who desire to purchase such a work.”

NEW YORK MEDICAL RECORD, February 27, 1892.—“This little book, that can be conveniently carried in the pocket, contains an immense amount of material. It is very useful, and, as the name of the author of each prescription is given, is unusually reliable.”

PRICE:—CLOTH, \$1.00; INTERLEAVED, FOR TAKING NOTES, \$1.25.

# Saunders' Question-Compends

Arranged in the form of Questions and Answers.

THE LATEST, CHEAPEST AND BEST ILLUSTRATED SERIES OF COMPENDS.

New York Medical Record, AUGUST 23d, 1890:—

"Where the work of preparing Students' Manuals is to end we cannot say, but the Saunders series, in our opinion, bears off the palm at present."

University Medical Magazine:—"Best of their class that have yet appeared."

Southern California Practitioner:—

"Mr. Saunders' series of Compends are the best ever published in this country."

No. 1.—ESSENTIALS OF PHYSIOLOGY. Third edition. Finely illustrated. Revised and greatly enlarged by H. A. HARE, M.D. (Price, \$1.00, net.)

No. 2.—ESSENTIALS OF SURGERY. With Appendix on Antiseptics. Fourth edition. 90 illustrations. By EDWARD MARTIN, M.D.

No. 3.—ESSENTIALS OF ANATOMY. Based on GRAY. Fourth edition. 180 illustrations. By CHARLES B. NANCREDE, M.D.

No. 4.—ESSENTIALS OF MEDICAL CHEMISTRY, ORGANIC AND INORGANIC. Third Revised edition. With an Appendix. By LAWRENCE WOLFF, M.D.

No. 5.—ESSENTIALS OF OBSTETRICS. Third edition. Revised and greatly enlarged. 75 illustrations. By W. EASTERLY ASHTON, M.D.

No. 6.—ESSENTIALS OF PATHOLOGY AND MORBID ANATOMY. Fourth thousand. 46 illustrations. By C. E. ARMAND SEMPLE, M.D.

No. 7.—ESSENTIALS OF MATERIA MEDICA. Therapeutic and Prescription Writing. Second edition. Sixth thousand. By HENRY MORRIS, M.D.

Nos. 8 and 9.—ESSENTIALS OF PRACTICE OF MEDICINE. By HENRY MORRIS, M.D. And an Appendix on URINE EXAMINATION. Illustrated. By LAWRENCE WOLFF, M.D. Second edition, enlarged by some 300 Essential Formulae, selected from eminent authorities, by WM. M. POWELL, M.D. (Double number, price, \$2.00)

No. 10.—ESSENTIALS OF GYNÆCOLOGY. With 58 illustrations. Second edition. By EDWIN B. CRAGIN, M.D.

No. 11.—ESSENTIALS OF DISEASES OF THE SKIN. Second edition. 75 illustrations. By HENRY W. STELWAGON, M.D.

No. 12.—ESSENTIALS OF MINOR SURGERY BANDAGING AND VENERAL DISEASES. 82 illustrations. By EDWARD MARTIN, M.D.

No. 13.—ESSENTIALS OF LEGAL MEDICINE, TOXICOLOGY AND HYGIENE. 130 illustrations. By C. E. ARMAND SEMPLE, M.D.

No. 14.—ESSENTIALS OF DISEASES OF THE EYE, NOSE AND THROAT. 118 illustrations. By EDWARD JACKSON, M.D., and E. BALDWIN GLEASON, M.D.

No. 15.—ESSENTIALS OF DISEASES OF CHILDREN. By WILLIAM M. POWELL, M.D.

No. 16.—ESSENTIALS OF EXAMINATION OF URINE. Colored "VOGEE SCALE," and numerous illustrations. By LAWRENCE WOLFF, M.D. (Price, 75 cents.)

No. 17.—ESSENTIALS OF DIAGNOSIS. By S. SOLIS-COHEN M.D. and A. A. GOHNER, M.D. 55 illustrations (some of which are colored), and a frontispiece. (Price, \$1.50, net.)

No. 18.—ESSENTIALS OF PRACTICE OF PHARMACY. By L. E. SAYRE.

No. 19.—ESSENTIALS OF HYGIENE. Illustrated. By ROBERT P. ROBINS, M.D. (Preparing.)

No. 20.—ESSENTIALS OF BACTERIOLOGY. 77 Illustrations (some colored). By M. V. BALL, M.D.

No. 21.—ESSENTIALS OF NERVOUS DISEASES AND INSANITY. 48 original illustrations. By JOHN C. SHAW, M.D.

No. 22.—ESSENTIALS OF MEDICAL PHYSICS. 155 illustrations. By FRED J. BROCKWAY, M.D. (Price, \$1.00, net.)

TO

J. W. HOLLAND, M.D.,

PROFESSOR OF MEDICAL CHEMISTRY AND TOXICOLOGY, JEFFERSON MEDICAL  
COLLEGE OF PHILADELPHIA,

WHO KINDLY ENCOURAGED THE WRITER

IN THE PREPARATION OF THIS

*LITTLE WORK,*

AND BEFRIENDED HIM IN MANY OTHER WAYS,

*This Volume*

IS GRATEFULLY INSCRIBED BY

THE AUTHOR.

## PREFACE TO THE FOURTH EDITION.

---

THE necessity of providing for another edition of this little work within less than two years since the last large edition was published cannot help but confirm the impression that it has proved itself useful and a desirable aid to the student of medicine.

The present edition was not found to need further additions, but it has been carefully revised to eliminate the few errors that were yet contained in its text.

The author wishes to express his thanks to the many teachers of this branch who have written to him approvingly of his work and have recommended it to their students, and he trusts that it may still continue to be appreciated by them.

L. W.

MAY, 1893.

## PREFACE TO THE THIRD EDITION.

---

THE call for a third edition of this little book, after two editions of two thousand copies of each have been exhausted within three years, is certainly gratifying to the author, and assures him that his aim to present it as an aid to the medical student in his pursuit of chemistry has been realized. He thinks that this compend has not interfered with more thorough reading from text-books, but has helped to make these better understood, and has thus rendered the path of the medical student in this direction less difficult.

It was not found necessary materially to enlarge the subject in this edition. But the text has been carefully gone over. A few errors were corrected, and several tables, of the elements, weights and measures with rules for converting them, thermometric scales, etc., were appended.

Trusting that this issue will have the same generous reception from all parts of the country which has been accorded to the former editions, the author hopes that it will be a welcome friend to the student, which will help him better to appreciate the subject under consideration, and in doing so extend his usefulness as a medical practitioner.

L. W.

AUGUST, 1891.

(v)

## PREFACE TO THE FIRST EDITION.

AN extensive experience in preparing medical students for examination in Chemistry has satisfied the writer that the incomplete knowledge of this department of medical science, so often exhibited by students and physicians, is generally due to their inability to study the subject thoroughly without encroaching in too great a degree on the time required for the more practical branches of their profession.

Most students appear to be justified in claiming that they have derived much profit from the systematic course of "quizzing" which is in vogue at the medical schools. This benefit is attributable, no doubt, to the fact that by this mode of instruction essential points are brought out in the form of questions which exact attentive consideration before adequate answers to them can be given.

In the volume here presented the author has the same object in view, and while he trusts that it will not be the means of dispensing with the deeper study of the subject, he feels assured that unless the frame-work of knowledge be first well constructed, substantial progress will be quite impossible.

If this little work shall tend to give students a better understanding of Chemistry, and with it a greater love, or perhaps less of a distaste, for the pursuit in connection with their medical studies, the writer considers that he will have achieved much of that which he attempted.

As an introductory course to Chemistry in most, if not in all, medical colleges includes the principles of Physics, some essential questions on this subject precede the chemical part of the work. Theoretical Chemistry, though treated in a separate chapter, is also frequently referred to throughout the text. The classification of the elements is somewhat at variance with the most modern ideas of pure Chemistry, but it has been given with the view of presenting the matter in logical sequence to the medical mind. Toxicology has received ample consideration under the head of each element or compound which possesses markedly poisonous properties. Analytical processes have been brought out as far as compatible with the condensation of so large a subject within so limited a space. No separate chapter or part is devoted to the "urine and its analysis," its components being considered in the order of their precedence in the adopted arrangement.

The questions and answers of this Manual have been so arranged as to conform to the principal text-books on the subject. For this purpose the authoritative works of Fownes, Attfield, Richter, Charles, Barker, and Witthaus, as well as Holland on the Urine, and Draper and Ganot on Physics, have been freely used in its preparation.

L. W.

PHILADELPHIA, PA., 333 South Twelfth St.

August, 1888.

# ESSENTIALS OF MEDICAL CHEMISTRY.

## PHYSICS.

### Weights, Measures, and Specific Gravity.

**What is weight?**

The amount of force necessary to neutralize the attraction of the earth upon a body.

**State the different kinds of weight.**

Apparent, absolute, and specific.

**Define these three.**

Apparent weight is that of a body in the air; absolute that in *vacuo*; specific, the relative weight of a body in comparison with that of the same volume of some other medium.

**Which system of weights and measures is employed in chemistry and chemical operations?**

The French or metric system based upon the metre as unit.

**Give the subdivisions of a metre.**

It is subdivided into 10 decimetres, 100 centimetres, 1000 millimetres.

**What are the terms for decimal multiples of the metre?**

10 metres equal to one dekametre.

100 metres equal to one hektometre.

1000 metres equal to one kilometre.

**State the unit of fluid measure of the metric system.**

The cube of one centimetre or one cubic centimetre, usually abbreviated as 1 c.c.

**How much is one litre?**

1000 cubic centimetres.

## 18 ESSENTIALS OF MEDICAL CHEMISTRY.

**Give the unit of metric weight.**

One gram, equal to 15.432 grains.

**How is the gram derived?**

From a cubic centimetre of distilled water at its maximum density (+ 4° C.).

**What are the decimal subdivisions of a gram?**

1 gram = 10 decigrams = 100 centigrams = 1000 milligrams.

**How are the decimal multiples of a gram designated?**

By Greek numerals. 10 grams = 1 dekagram ; 100 grams = 1 hektogram ; 1000 grams = 1 kilogram.

**Give the equivalents in Troy weight of 1 gram, 1 kilogram,  
also in grams of 1 grain and 1 oz. Troy.**

1 gram = 15.434 grains ; 1 kilogram = 2.679 lbs. Troy ; 1 grain = 0.065 grams ; 1 oz. Troy = 31.103 grams.

**What are scales and balances?**

Instruments to determine the weights of bodies.

**State what chemical balances are, and their principal parts.**

Instruments indicating at least one milligram, having knife edges on which the beams and hangers are equipoised.

**How are chemical balances steadied, and how should they be  
kept?**

They are steadied by rests to keep them in a state of repose ; they should be well levelled on a solid foundation in glass cases to prevent the influences of draughts of air, weather, heat, dust, etc.

**By what means are minute differences of weight determined ?**

By riders placed on notches on the beam.

**When a bdy is weighed in air and then in water, where is it  
the heaviest ?**

When weighed in air.

**What is the loss of weight it experiences in water ?**

As much as the weight of the volume of water it displaces.

**What is its specific weight or gravity then ?**

The relative proportion between its weight in air and its loss of weight in water.

**How is the specific gravity of a body heavier than water determined ?**

By weighing the body first in air and then immersed in water, determining the difference between the two, and then dividing the weight in air by that difference.

**If a body is lighter than water how is its specific gravity obtained ?**

Attach it to another body heavier than water, the loss of weight of which in water has been previously ascertained. Find out the loss in water of both together and deduct the loss of the heavier one from it ; the difference will be that of the lighter body alone, with which divide its weight in air.

**If a body is soluble in water how is its specific gravity obtained ?**

By immersing it in another incompatible liquid of known sp. gr., dividing with its loss therein the weight in air, and then multiplying with sp. gr. of the liquid used.

**State what a Pyknometer is, and how the specific gravity of liquids is ascertained with it.**

A specific gravity bottle having a glass stopper with a capillary opening through it, and usually of a size to contain accurately 1000 grains distilled water at 4° C. If this is well filled with the liquid to be examined, and then dried externally and placed on the scales, the increased or decreased amount of the weight of the same divided by 1000 will give its specific gravity. The weight of the bottle in this operation must be counterpoised or tared ; the temperature of the other liquid should be at 0° C. or computed for that degree.

**What is the law of Archimedes ?**

A body immersed in water loses part of its weight equal to the weight of the displaced liquid.

**State the position an egg will occupy in pure water and in a saturated solution of sodium chloride, and give the reason for the same.**

In pure water it sinks, in saturated Na Cl solution it floats, because the liquid displaced by it in the pure water is lighter than its own weight and heavier in the Na Cl solution, thus buoying it up in the latter.

**What instruments are based on the above experiment, and what are they used for, and what are their names according to application?**

Hydrometers, used for readily ascertaining the specific gravity of liquids, called, according to their use, urinometers, alcoholometers, lactometers, etc.

**How is the scale of hydrometers arranged?**

For liquids heavier than water the sp. gr. scale of hydrometers has 1000 on top and the heavier marks below; the hydrometers intended for taking the sp. gr. of lighter liquids is marked 1000 at the bottom of the scale and the lighter degrees are above.

**What are urinometers, and what is the extent of their scales?**

Hydrometers intended for taking the sp. gr. of urine: marked from 1000 at the top to about 1060 at the bottom.

**How is the specific gravity of a liquid observed by a hydrometer?**

By partly filling the cylinder with the liquid to be examined, floating the instrument therein, then filling carefully to the top of the cylinder, and reading the mark over the top of the liquid.

**How is the quality of good hydrometers ascertained?**

By immersing in various liquids of known specific gravity and comparing the marks indicated with those known of the liquids.

## Heat—Thermometers.

**What is heat?**

A condition of matter manifesting itself by physical phenomena and convertible into other forms of force.

**When two bodies of different temperature are brought in contact what is the result?**

They tend to equalize the amount of heat they are respectively possessed of.

**If equal quantities of water of the temperature of 100° C. and of 162° C. are mixed together what will be the temperature of the mixture?**

The mean of the two or 131° C.

**If equal quantities of water at 0° C. and mercury at 100° C. are mixed, what is the temperature of the mixture, and why?**

The mixture will be at 3.3° C., because the heat capacity of water is 1000 to 0.033 for mercury; *i.e.*, the water requires about 33 times as much heat as mercury to elevate it to the same temperature.

**What is the individual heat capacity of bodies termed, and how defined?**

Their specific heat, or the amount of heat necessary to raise the temperature of a body one degree compared with that required to raise the temperature of the same weight of water one degree.

**What is a calorie and what a thermal unit (English)?**

The quantity of heat necessary to raise one kilogram of water through one degree centigrade is one calorie (large); that necessary to raise one gram through one degree centigrade is the small or chemical calorie; that required to raise one pound of water through one degree centigrade, one thermal unit = 0.45 calorie (large); one large calorie = 2.2 thermal units.

**What is the temperature of a mixture of equal weights of water of 60° C. and of 0° C.?**

30° C.

**What is the temperature of equal weights of water at 60° C. and ice at 0° C.?**

It will remain at 0° C. until all the ice is melted.

**Why is this so?**

Because the ice absorbs all the heat of the water to accomplish its change from the solid to the liquid state.

**What is the heat absorbed by bodies in their change of state, not indicated by the thermometer, called?**

Latent heat.

**What three states of matter are there?**

Solid, liquid, and gaseous.

**What is matter composed of?**

Molecules and interspaces.

**What are molecules?**

The smallest physical units of matter.

**State the relative condition of molecules in solid, liquid, and gaseous bodies.**

In *solids*, the relative positions of the molecules are fixed, and cannot be changed without the expenditure of more or less force. In *liquids*, the relative positions of the molecules are not fixed, they glide past each other coherently, while in *gaseous* bodies the molecules repel each other, and tend to occupy larger spaces.

**If a metal ball fitting closely into a ring be heated and then placed in the ring, what is the result?**

It will no longer pass through it until it again returns to its ordinary temperature.

**What can be said to be the effect of heat on bodies, and what on different forms of matter?**

They are expanded by increase of temperature, and contracted by its decrease. The expansion in solids is small, in liquids greater, and for gases the greatest.

**As matter is composed of molecules and interspaces, which of the two are thus expanded by heat?**

The interspaces, as the molecule is a unit, and cannot increase or decrease in size.

**What is a thermometer?**

A glass bulb containing air connected with a narrow tube containing a liquid. Very slight variations of temperature are indicated thus by a change of position of the liquid.

If a bulb of alcohol or mercury or other liquid, to which is attached a narrow tube, is heated, what is the result ?  
The liquid ascends in the tube.

**What are thermometers ?**

Instruments for measuring temperature.

**How are they constructed ?**

They consist of a bulb of liquid attached to a closed and airless capillary tube ; this latter is graduated to indicate the degrees of temperature.

**What thermometers are principally used, which preferably, and why ?**

Alcohol and mercury thermometers ; the latter preferably, because the mercury does not wet the glass tube, and does not boil so readily as alcohol.

**When are alcohol thermometers to be preferred ?**

To measure very low degrees of temperature when mercury would freeze.

**Which are the principal scales of the thermometer in use ?**

Fahrenheit and Centigrade (Réaumur also).

**How is the Fahrenheit scale graduated ?**

It is divided into 212 equal divisions or degrees, the lowest of which is a mixture of equal parts of sal-ammonia and snow, and the highest the boiling point of pure water ; the freezing point of water on this scale is  $32^{\circ}$ .

**How is the Centigrade scale graduated ?**

By division into 100 equal parts or degrees, the space of expansion from the freezing point to the boiling point of pure water.

**Which is commonly used, and which in chemistry ?**

The Fahrenheit scale is in common use in this country, the Centigrade scale in chemistry.

**How are degrees of Centigrade scale converted into those of Fahrenheit ?**

As the number of degrees between the boiling and freezing

point of water in Centigrade is 100 and in Fahrenheit  $212 - 32 = 180$ , the proportion would be

$$100 : 180 \div \text{degree to be converted} : x$$

by division with 20 it would read

$$5 : 9 \div \text{cent.} : x$$

i. e., the degree to be converted is multiplied with 9, the result divided by 5, and 32 added to the result, as per following formula :

$$\frac{\text{Cent.} \times 9}{5} + 32 = \text{Fahr.}$$

### **How are degrees of Fahrenheit converted into Centigrade ?**

From the degree to be converted 32 is subtracted, the difference is divided by 9, and the quotient multiplied by 5, as per

$$\frac{\text{Fahr.} - 32}{9} \times 5 = \text{Centigrade.}$$

### **What are clinical thermometers, and what their range ?**

Thermometers for determining the temperature of the body. Their scale ranges usually from 90 -110° F.

### **What are self-registering thermometers, and what are indestructible registers ?**

Thermometers which have a small separate column of mercury, which is shoved up by expansion, but does not contract with the main column, are called self-registering. If these registers are so arranged that they cannot slip down, or be shaken down into the bulb, they are called indestructible.

### **Why are new thermometers usually incorrect, and what should be done with them ?**

On account of the contraction of the glass going on for some years, they should for that reason be seasoned at least three years before being marked.

### **How are thermometers standardized ?**

They are compared, at their different degrees, with other instruments known to be correct.

## MAGNETISM.

**What is magnetism?**

The force by which loadstone attracts iron.

**Give the chemical name and composition of loadstone.**

Magnetic oxide of iron :  $\text{Fe}_3\text{O}_4 = \text{FeO} \cdot \text{Fe}_2\text{O}_3$  = Ferrous-ferric oxide.

**Describe natural, temporary, and permanent magnets.**

Loadstone is a natural magnet. Soft iron, in which magnetism is induced, is a temporary magnet. Steel, when magnetized, becomes a permanent, artificial magnet.

**What are magnetic poles and what neutral lines?**

The ends of magnetic bars are termed their poles ; the middle line between them, which has no power of attraction, is their neutral line.

**State what the magnetic axis is.**

The shortest lines between the poles.

**Which is the north pole and which is the south pole of a magnet in this country?**

The pole pointing to the north is the north pole, that pointing to the south the south pole ; in France and China the reverse terms are in use.

**When particles of soft iron are in contact or influenced by a magnet, what do they become in turn?**

Temporary magnets.

**Give the action of a magnet on iron filings.**

They become, each particle, magnets of more or less strength, and consequently arrange themselves into tufts.

**What is magnetic induction?**

The production of magnetism in other substances either by direct or indirect contact.

**Can magnetism be induced by contact only?**

No, it may even act through different media, such as glass, wood, paper, etc.

**Does iron alone show magnetic polarity?**

Its compounds also, as well as those of nickel and cobalt, give evidence of it.

**If a magnet is broken in two or into many pieces, what is the magnetic condition of each piece?**

Each piece is a distinct magnet with different poles, as one kind of polarity cannot exist without the other.

**What is the hypothesis of magnetism?**

That each molecule of a magnet shows magnetic polarity.

**If a magnet is evenly balanced or suspended in the middle what position does it assume?**

It places itself in the direction of the magnetic poles of the earth.

**About what distance are the terrestrial magnetic poles from the true poles?**

More or less 1000 miles, varying according to the magnetic axis.

**Give the meaning of declination of the magnetic needle.**

The angle it makes with the meridian.

**What instrument for orientation is based upon the north and south direction of the magnetic needle.**

The mariner's compass.

**State the result of approaching the north end of the magnetic needle with the north pole of a magnet.**

The needle point is repelled, and if the north point is approached by the south pole of a magnet it is attracted.

**What law is based upon this?**

Like poles repel, unlike attract.

**If an unmagnetized steel needle is suspended in the middle and subsequently magnetized, what occurs besides its orientation?**

It dips towards the poles, increasing in this respect the nearer it approaches them.

**What is this called ?**

The dip or inclination of the magnetic needle.

**What is a horseshoe magnet, and what is its object?**

A magnetic bar bent in horseshoe shape, the two poles thus acting by induction upon each other, and increasing each other's power.

**What is a magnetic battery or a Germain magnet?**

A series of magnetic steel plates joined with their similar poles, making the magnet very powerful.

**What is an armature ?**

A piece of soft iron closing the space between the poles of the horseshoe magnet, intended to preserve its magnetic force, which would otherwise be gradually lost.

**Are other bodies besides those known as magnetic affected by magnetism ?**

Many bodies are so affected, especially the metals, but in much less degree than iron, nickel, and cobalt.

**What is paramagnetism ?**

The power of magnets to direct substances affected by them in an axial position, *i. e.*, parallel with the magnetic axis; such as iron, nickel, cobalt, manganese, chromium, etc.; the substances so affected are called paramagnetic.

**What is diamagnetism ?**

The power of magnets to give certain substances, influenced by them, a direction at right angles to the magnetic axis; such as bismuth, antimony, zinc, tin, etc. These are called diamagnetic.

**When two magnetic bars of equal power are joined with unlike poles together what is the attracting force of the two together?**

They neutralize each other, and have no attracting force.

**What are astatic needles ?**

Magnetic needles placed so that the north end of the one is counteracted by the south end of the other. They lose their power of orientation.

## ELECTRICITY.

**What is Franklinism?**

Frictional or static electricity ; a physical condition produced in certain bodies, such as glass or resins, by friction with silk, wool, or catskin.

**What are its principal properties?**

Those of attracting small light bodies such as paper, feathers, etc., and of repelling them on contact.

**How is this best shown?**

By an electroscope.

**Describe a gold-leaf electroscope.**

It is an instrument for detecting electricity, consisting of two strips of gold leaf suspended together at one end in a glass jar and connected through the cover with a metallic bar and knob. When the latter is touched or approached with an electrified body the two strips fly apart, because they become equally electrified and repel each other.

**What electricity is produced by the friction of glass?**

Vitreous or positive electricity.

**What from resins?**

Resinous or negative electricity.

**What are conductors, and what are non-conductors of electricity?**

Bodies conveying it are conductors ; bodies not capable of conveying it are non-conductors.

**What is the law of conductivity?**

Conductivity is inversely to resistance.

**What are insulators?**

Non-conductors.

**What is the law of electric attraction and repulsion?**

Bodies charged with the same electricity repel each other; bodies charged with opposite electricity attract each other; or like electricities repel, unlike attract.

**How is electricity distributed in bodies?**

On the surface, with increased polarity at projections, from which, if sufficiently attenuated, it may even discharge itself into the surrounding air.

**How may electricity be produced besides by friction?**

By induction; electrified bodies attracting in neighboring bodies, not in contact with them, electricity of a different denomination towards them.

**What is the arrangement of simple cylinder electric machines?**

They consist of a glass cylinder, which, by a crank, may be rotated against a silk cloth or cushion containing amalgam. Close to this cylinder is an insulated metal globe which presents a number of points towards it. As fast as the positive electricity is exerted in the glass, the negative induced in the globe escapes to it from the points, and leaves the residuary positive electricity in the metallic insulated globe to increase with each rotation.

**What is an electrophorus?**

An apparatus by which, through difference of potential and induction, considerable electricity may be stored up and discharged. It consists of a metal cover with an insulated handle placed on an electrified layer of shellac or resin; in this way its lower surface becomes positive and the upper negative. If the negative is discharged the more positive accumulates, and if lifted off will give a positive spark.

**What is a Toepler-Hertz machine, and upon what principle is it based?**

An electrical machine consisting of two upright glass plates, one stationary, and of uneven potential, which by rotation is multiplied, and by induction stores up electricity in the armature of the fixed plate. The principle is similar to that of the electrophorus.

**What is an electrometer?**

A pith ball attached to a movable lever repelled from a knob electrified with the same denomination, thus indicating the electric tension.

**What are Leyden jars, and what batteries?**

Instruments for the accumulation of electricity ; they consist of glass jars coated inside and outside with tinfoil, the inner being connected with a wire and knob. When the outer connects with the earth and the inner with an electrical apparatus, they become charged respectively with negative and positive electricity, and when so charged may be discharged and give rise to a spark. If several such jars are connected together to increase their effect, they are termed an electric or Leyden battery.

**What is the character of electric sparks?**

They move in the air in broken lines, as the air offers resistance to their passage by becoming condensed ; thus the zigzag course of lightning.

**What are the phenomena displayed by insulated electrified persons?**

Their hair, when dry, stands on end, and sparks may be drawn from their bodies.

**State the medical use of static electricity.**

In nervous affections, hysteria, and palsy, the patient being insulated, and sparks drawn from him, then muscular contractions will ensue.

**What is thermoelectricity?**

The electricity produced when two different metals joined together at each end have their joints unevenly heated ; the strength of this depends on the difference of temperature between the two joints.

**What are the thermoelectric batteries or piles?**

A combination of thermoelectric pairs, principally of bismuth and antimony, or platinum and iron, so that heat may be applied to, respectively, the first, third, fifth, etc., joints, while the others are kept cool.

**What is the principal use of thermoelectric piles or batteries?**

To indicate slight changes of temperature by its effect upon the needle of the galvanometer.

**What is galvanism?**

Chemical electricity, also termed voltaism, also dynamic electricity ; the electricity produced when two bodies are immersed in a liquid, acting on them with unequal chemical energy.

**What are the bodies generally employed for this purpose, and which are the principal ones?**

The metals more generally, and zinc always one of them. Thus, zinc and copper, zinc and carbon, zinc and platinum, zinc and silver, etc.

**What are such two plates termed, and what a series of them?**

A voltaic couple or element ; a series of them a voltaic column or pile.

**Which is the positive and which is the negative plate?**

The one being acted upon more energetically is termed the generating plate and has a *higher potential*; the current flows from it to the *lower potential*; the plate from which the current flows in the liquid being termed *the positive*, while the one to which it flows through the liquid is *the negative*.

**When the two plates are joined outside of the liquid by the polar wire, in which direction does the current flow therein?**

The outside current flows from the negative plate to the positive. The ends of the wires are termed *poles* or *electrodes*, and their denomination is the opposite from that of the plates they are attached to. Thus the one attached to the negative plate is at its termination called the positive pole or electrode, while the other attached to the positive plate forms the negative pole.

**What are the positive and negative poles also called?**

The positive pole is called anode, and the negative pole cathode.

**If plates of zinc and copper are immersed in dilute sulphuric acid, and connected outside of the fluid by a wire, what results?**

There will be an energetic chemical action at the zinc plate, but the disengaged hydrogen will accumulate at the copper plate in such a measure as soon to stop the galvanic current passing through the wire ; the copper plate is then said to be polarized.

**What is then polarization of the plates, and how avoided ?**

Polarization of the plates means the accumulation of disengaged gas thereon, and the consequent interruption of the current. The polarization may be corrected by mechanical means, such as shaking, etc., or, as shown subsequently, by special arrangement of the fluid or fluids, so that the disengaged hydrogen will be chemically bound in the fluid.

**Why should the zinc plates be amalgamated ?**

To overcome local action or currents caused by the impurities of the zinc and other metals present therein.

**What are galvanic elements, and what batteries ?**

A single cell, containing two plates of different potential, immersed in suitable battery fluid in a stone, glass, or rubber vessel, constitutes an element ; and a number of them, properly arranged or coupled, are termed a galvanic battery.

**What is a Daniell's element ? what its advantage ? about what is it equal to in electromotive force ? and what is the object of its arrangement ?**

A glass vessel containing a saturated solution of copper sulphate, and in this a copper cylinder. Immersed in the copper solution, and inside the copper cylinder, is a porous cup filled with dilute sulphuric acid and containing a zinc cylinder. Its constancy of action makes it of special advantage, and it is for this reason that its electromotive force is accepted as a unit or nearly so. The principle of its action is chemically to overcome polarization ; for as the hydrogen from the zinc passes to the copper it decomposes the copper sulphate solution, substituting the atom of copper of the  $\text{CuSO}_4$ , forming thus  $\text{H}_2\text{SO}_4$  ; the lib-

erated copper is deposited on the outside copper cylinder, while the newly-formed  $H_2SO_4$  passes into the porous vessel to act on the zinc.

**Describe the arrangement of a Grove's element.**

A two-fluid cell, containing, outside, zinc, immersed in dilute sulphuric acid; inside the porous cup is a platinum slip in nitric acid. The hydrogen evolved at the zinc, and passing to the platinum, decomposes the nitric acid, thus also chemically preventing polarization.

**What is a Bunsen's element?**

A two-fluid cell, arranged similar to Grove's, with a compressed gas retort carbon being substituted for the platinum. The object and principle are the same as in the former.

**What is a Smee's element, and how is polarization prevented by it?**

A single fluid cell, in which a platinum sheet is immersed in dilute sulphuric acid between two zinc plates. The platinum sheet is covered with small fragments of platinum, or a silver plate covered with finely divided platinum may be substituted for it; the platinum particles *mechanically* aiding the disengagement of the hydrogen from the platinum.

**Describe the arrangement of a Grenet cell.**

A one-fluid cell, containing two fixed carbon plates, immersed in a battery fluid of sulphuric acid and potassium bichromate. Between the carbons is a zinc plate which can be lowered into the fluid to set it in action. The object of the potassium bichromate is to form chromic acid, which oxidizes the hydrogen into water.

**Give the arrangement of a Leclanché element.**

A porous cup containing a carbon rod, surrounded by pieces of peroxide of manganese and gas carbon. Outside the porous cup is a saturated solution of ammonium chloride, and immersed in it a rod of zinc.

**What is a Calland's or gravity element?**

A modification of Daniell's element, doing away with the

porous cup. It consists of a star-shaped copper plate at the bottom of the vessel, which is surrounded by pieces of copper sulphate ; it is immersed in a saturated solution of the same substance. The upper half of the vessel is occupied by dilute sulphuric acid, which, by the difference of density, floats on the copper solution, and contains suspended in it a star-shaped arrangement of zinc. Its action is the same as in the Daniell, and is very constant ; it is principally used in telegraphy.

**What is the electrical tension or potential ?**

The electricity accumulated at certain points.

**What is electromotive force ?**

The amount of electricity generated by an electrical battery. It is generally accepted as the difference of potential of the two plates.

**What is the electromotive series of metals ?**

The arrangement of metals according to their electrical deportment ; the most electropositive being at one end and the most electronegative at the other, as follows : 1. Zinc. 2. Cadmium. 3. Tin. 4. Lead. 5. Iron. 6. Nickel. 7. Bismuth. 8. Antimony. 9. Copper. 10. Silver. 11. Gold. 12. Platinum. 13. Graphite. Thus iron in dilute sulphuric acid is electronegative to zinc but electropositive to copper.

**What is the law for the electromotive force between two metals ?**

That the electromotive force between two metals is equal to the sum of the electromotive forces between all the intervening metals.

**What is a volt ?**

The unit of electric pressure or electromotive force. It is about the electromotive force of one Daniell's element.

**What is generally understood by the electric current ?**

The current of electricity passing through the wire.

**What is the direction of the outside current ?**

From the electronegative plate (carbon or copper), to the electropositive (zinc).

**On what does the current strength depend, and by what is it diminished?**

The current strength depends on the amount of electromotive force, and is diminished by the resistance which it encounters.

**How may the relations then be stated?**

The current strength is directly proportional with the electromotive force and inversely with the resistance.

**What is the resistance, and what two resistances do we encounter in a galvanic cell?**

The force opposing the flow of the current is the resistance ; that existing in the liquid between the plates is termed internal resistance ; that diminishing the conductivity of the wire is called external resistance.

**What is the law governing the resistance of a conducting wire?**

The resistance is inversely as the cross section, and directly as the length of a conductor.

**What is the unit of resistance?**

The "Ohm;" the resistance offered by a column of mercury, 104.81 centimetres long, one square millimetre in section at 0 ° C.

**What is the unit by which current strength is computed?**

The ampère ; the current strength of one volt of electromotive force passing through a circuit having one Ohm resistance.

**How may the current strength be computed?**

By the Ohm's law ; the current strength is equal to the electromotive force divided by the resistance, as per following formula :  $C = \frac{E}{R}$

**Of what advantage is the application of the Ohm's law in galvanism?**

The advantageous coupling of the elements with a view to greater intensity or quantity.

**When is the combination best for producing intensity?**

By increasing the internal resistance ; *i. e.*, coupling the different elements separately as such, as needed in galvanization of muscles and nerves, and also in electrolysis.

**How are the elements to be coupled for quantity?**

By combining all the zines together and also the carbons, thus diminishing internal resistance; this is the combination employed for galvano-cautery and lighting purposes.

**How is electric light produced for medical purposes?**

By passing a galvanic current of quantity through a carbon filament or platinum wire contained in an airless glass globe, when the resistance to the current will produce the luminous effect.

**What is the principle of the galvano-cautery?**

A thin platinum wire by the passage of a quantity of electricity will be intensely heated, and can then be applied for cautery purposes.

**What is the effect of an electric current passing around a magnetic needle?**

It will deflect the needle from its position.

**In which direction is the needle deflected by the galvanic current?**

This depends upon the direction the current passes, and if above or below the needle. For ready comprehension a person may imagine himself floating in the current with the head in direction of the current and facing the needle, when the north end of the needle will be deflected to the left.

**What is a galvanometer?**

An instrument so arranged as to indicate by the deflection of the needle the existence, direction, and intensity of currents. It is generally composed of astatic needles and multipliers.

**What instruments are employed to indicate the current strength for medical purposes?**

Those indicating the amount of ampères, or rather milli-ampères, passing through the circuit. They are termed ampère or milli-ampère-meters.

**What is the effect of an electric current passing around soft iron?**

It makes a very powerful temporary magnet.

**When the current is broken or opened, and when made or closed, what takes place, and to what purpose is it applied?**

The iron is magnetized when the circuit is closed, and becomes demagnetized when opened. On these phenomena the electric telegraph is based.

**What is Faradism?**

The electricity developed by induction from the galvanic current.

**How can this be illustrated?**

By placing a wire, *not* connected with any battery, close and parallel with a wire connected with a galvanic battery; there will be an electrical manifestation in the former every time the galvanic current is made or broken.

**How does the induced current make itself manifest, and in what direction does it flow?**

It is not a steady current, deflecting the galvanometer needle only at the time the primary current is closed or open. When the current is closed, it flows in an opposite direction to the primary current, but on breaking it is reversed.

**Has the faradic current chemical properties, and if not, why not?**

It has no chemical powers, because it is a to and fro current, and its action in one direction is neutralized by the return flow.

**How may very powerful electric manifestations of the induced current be developed?**

By multiplying the secondary wire.

**What are the instruments for this purpose, and component parts?**

Ruhmkorff coils; consisting of a primary coil, an iron core therein, an automatic breakpiece or interrupter, a secondary coil, and an accumulator or condenser for the extra current.

**Which is the longer, the primary or secondary coil?**

The secondary, which is on the outside, and often contains many miles of wire.

**What is the object of the iron core?**

To attract the breakpiece when it becomes magnetized.

**What is the breakpiece?**

A spring connecting with the primary wire by a small plate of platinum, and having a small hammer end, which is attracted when the core is magnetized ; it thus breaks the current, and springs back when the core is demagnetized, when the current is again made.

**What does the condenser consist of, and what is its object?**

It consists of layers of glass covered with tinfoil, acting on the principle of a Leyden jar. It accumulates and condenses the extra current.

**On what principle are medical faradic batteries constructed?**

Similar to that of the Ruhmkorff coil with a Grenet cell to furnish the primary current.

**What measures should be adopted to insure the good working of a faradic battery?**

The interrupter should be kept free from rust and corrosive material ; all connections should be tight, insulations should be complete, and the battery fluid should not be allowed to dry out, or become decomposed.

**When the purely faradic current is employed, does it matter how the poles are disposed of?**

No ; as the current goes both ways.

**What is the principal use of the faradic current in medicine?**

To excite nerves or bring about muscular contractions, both for diagnostic and therapeutic purposes.

**What is the use of the constant galvanic current in medicine?**

For nerve stimulation, for cautery, and for its chemical effect.

**What is the chemical effect of the galvanic current, and what is it termed?**

The chemical decomposition of compounds in a fluid state ; it is termed electrolysis.

**What takes place when water is subjected to electrolysis, and how does it take place?**

It is decomposed into its constituent elements, hydrogen and oxygen. The hydrogen accumulating at the negative (—), the oxygen at the positive (+) pole or electrode.

**What are substances called subjected to electrolysis? what the results? what are those which go to the positive and those that go to the negative pole?**

The products of decomposition are termed IONS; the subjects for electrolysis are electrolytes; those which go to the negative pole, the cathode, cathions; those which go to the positive pole, the anode, anions.

**What takes place if a galvanic needle is inserted in the human body?**

The salts and fluids are decomposed; alkalies and hydrogen go to the negative; oxygen and acids go to the positive pole.

**What is electrolysis used for in medicine?**

For removing tumors, hairs, naevi, warts, etc.

**In the electrolysis of tumors, what needle should be inserted into them, which in aneurisms, and why?**

The electronegative in tumors, the electropositive in aneurisms; because the alkalies at the negative pole liquefy the tissues, while the acids at the positive pole condense them, and coagulate the blood.

## C H E M I S T R Y.

### **What is chemistry?**

That branch of physical science which treats of the composition of matter.

### **What are physical, what chemical changes?**

Physical changes are those which do not affect the composition or construction of the molecule ; chemical changes, those altering its character, and thus changing matter itself.

### **What is chemism?**

That form of attraction which takes place between atoms.

### **What is a molecule?**

The smallest particle of matter that can exist in a free state, and cannot be divided without losing its character.

### **What is an atom?**

The chemical unit of matter produced by the breaking up of the molecule.

### **How may matter be subdivided?**

Into simple or elementary and compound matter ; termed relatively elements and compounds.

### **Define simple or elementary and compound matter.**

Matter made up of molecules, containing like atoms, is elementary ; that whose molecules are made up of dissimilar atoms is termed compound.

### **How many elements and therefore different kinds of atoms are known?**

At the present time about sixty-six are definitely known as such.

### **How are atoms designated in chemical notation? example.**

By symbols, consisting of the first, or the first and some other letter of their Latin name. H for hydrogen, B for bismuth, Pb for lead (Plumbum), Hg for mercury (hydrargyrum), etc.

**What do symbols express besides the atomic character?**

The atomic weight.

**What is atomic weight?**

The relative weight of an atom in comparison with the hydrogen atom as a unit. It also expresses the smallest quantity of an elementary substance capable of entering into the formation of a chemical compound.

**In which way is the quality of the combining power of an atom expressed?**

By its electrical polarity in relation to another atom. Thus, atoms are either *electropositive*, *i. e.*, accumulating at the electronegative pole, or *electronegative*, *i. e.*, accumulating at the electropositive pole during the electrolysis of a compound.

**Is the electro-chemical character of atoms definite or relative?**

It is relative in so far that an atom is electropositive towards some, electronegative towards others, but it is definite in these relations; thus, the metals are electropositive to the metalloids, and these are electronegative to the former.

**What is the quantity of atomic combining power?**

The fact that some atoms can combine with one atom of hydrogen, and others with two, three, and more of it, demonstrates the quantitative combining power of atoms.

**What is then the equivalence of an atom?**

The quantity of its combining power expressed in hydrogen units, or the number of hydrogen atoms it can combine with, or be exchanged for.

**How is the equivalence of atoms expressed, and how is it written in notation?**

Either by the use of Greek numerals, as monads, dyads, triads, tetrads, pentads, hexads, and heptads, or by Latin numerals, as univalents, bivalents, trivalents, quadrivalents, quinquivalents, sexivals, and septivals. In chemical notation this is expressed by placing Roman numerals above, and to the right of the symbol:  $H^I$ .  $O^{II}$ .  $N^{III}$ .  $C^{IV}$ .  $As^{V}$ .  $S^{VI}$ .  $Cl^{VII}$ .

**How may the equivalence of the atom be graphically represented?**

By illustrating the atom as a small ring or dot or symbol, and the equivalence by lines radiating from it ; these lines are termed bonds, as follows :—

Monad.

Diad.

Triad.

Tetrad.

Pentad.

Hexad.

Heptad.

**When an atom combines with another in several proportions, what characteristic series appear, and into what two groups are they accordingly classed?**

Its higher compound always increases by two, as for instance, 1, 3, 5, and 7, or 2, 4, and 6. These two can never interchange, and the series whose equivalents are in even numbers are termed *artials*, while the odd are called *perissials*.

**In which way are multiples of atoms expressed in chemical notation?**

By placing small Arabic numerals to the right and below the symbol, for instance, Cl<sub>2</sub>, O<sub>3</sub>, As<sub>4</sub>.

**What do groups of atoms represent, and what is their chemical notation termed?**

They represent a molecule, and their designation in chemical notation is termed a *formula* ; for example, NaCl, H<sub>2</sub>So<sub>4</sub>, etc.

**How are multiples of molecules expressed?**

By inclosing their component symbols in parentheses and placing a small Arabic numeral outside to the right and below, or by placing a larger numeral before the molecule without parentheses ; thus, (NaCl)<sub>2</sub> = 2 NaCl.

**In which way is a reaction to take place between two chemical bodies designated, how its completion, and how the product or products?**

Before the reaction takes place they are separated by a plus sign (+), the union complete by an equation sign (=), and the product by its formula, or, if more than one, they are separated by plus signs ; example, NaOH + HCl = NaCl + H<sub>2</sub>O.

**What are empirical, what rational, and what graphical formulæ?**

An empirical formula is one expressing the kind and number of atoms in the molecule. A rational formula indicates, besides this, the arrangement of the atoms in the molecule. The graphical are simply illustrations of rational formulae.

**What two kinds of molecules can be chemically distinguished?**

The elementary molecules composed of atoms of the same kind, and the compound, composed of atoms of dissimilar elements.

**Give the definition of molecular weight.**

The sum of the atomic weights of a molecule.

**How may compound molecules be classified?**

*Binary* molecules in which the atoms unite directly, and *ternary* molecules in which the atoms are indirectly united.

**Of how many kinds of atoms are binary molecules always composed?**

Of only two different kinds of atoms.

**What is the rule for naming binary molecules?**

As they must be composed of electropositive and electronegative elements, the electropositive is always placed with its full termination first, while the electronegative has its terminal syllable changed to "ide"; thus, potassium chloride, hydrogen sulphide, calcium fluoride, etc.

**When an electropositive element unites with the electronegative in more than one proportion how are the two compounds distinguished by name ?**

By the affix of "ic" to the one and "ous" to the other; examples : mercuric oxide, mercurous oxide ; ferric chloride, ferrous chloride.

**When there are other compounds by change of valence how are they expressed by name ?**

The electropositive of the lower receives before its name the affix of "hypo" and the highest that of "per"; thus, hypo-chlorous oxide and per-chloric oxide.

**How are multiples of the same kind of atoms in the name of the compound molecule expressed ?**

By the prefix of Greek numerals, such as carbon dioxide, sulphur trioxide, nitrogen tetroxide, arsenic pentoxide. Sometimes the multiple of the electropositive is similarly expressed, as in di-nitrogen tetroxide, di-arsenic pentoxide.

**What are compound radicals ?**

Unsaturated molecules, not existing in a free state, but capable of uniting directly with an atom or a similar compound to form saturated molecules.

**What is the rule for naming them and their compounds with atoms ?**

That they end in yl; example : HIO—Hydroxyl; but some, as amidogen NH<sub>2</sub>—Cyanogen CN—differ in this. Their compounds with atoms are subject to the same terminology as binary molecules.

**What is a ternary molecule ?**

One in which two dissimilar atoms are united by means of a third having linking functions.

**Which are the atoms having linking functions ?**

The principal one is oxygen, but sulphur, selenium, and tellurium also possess this function.

**What three classes of ternary molecules are distinguished ?**

Acids, bases, and salts.

**What two kinds of acids do we distinguish ?**

Binary or hydracids, and ternary or oxyacids.

**Give the definition of an acid.**

A compound of hydrogen with an electronegative which can give up its hydrogen for the metal of a base to form a salt.

**How is an oxyacid constituted ?**

It is a compound in which hydrogen is united by oxygen to an electronegative.  $\text{H}-\overset{+}{\text{O}}-\overset{-}{\text{R}}$ .

**What is a base ?**

A compound containing hydrogen united by oxygen to an electropositive.  $\overset{+}{\text{H}}-\overset{-}{\text{O}}-\overset{+}{\text{R}}$ .

**What is a salt ?**

A compound in which one or more electropositive atoms are united by oxygen to one or more electronegative atoms.  
 $\overset{-}{\text{R}}-\overset{+}{\text{O}}-\overset{-}{\text{R}}$ .

**What are the characteristic properties of bases, and what of acids ?**

Bases turn turmeric paper brown, and reddened litmus paper blue ; acids turn blue litmus paper red.

**Upon what type may the above be said to be formed ?**

The water type, because by replacing one H of  $\text{H}-\text{O}-\text{H}$  with  $\overset{-}{\text{R}}$  an acid is formed, by  $\overset{+}{\text{R}}$  a base ; by replacing both H, one with  $\overset{-}{\text{R}}$  the other with  $\overset{+}{\text{R}}$ , a salt results.

**What names are applied to the bases ?**

Considered as compounds of the radical hydroxyl, they are named hydroxides or hydrates ; thus, KOH potassium hydrate, NaOH sodium hydrate.

**What terminal endings are affixed to the acids ?**

Acids are expressed by the affix of "ic" to the abbreviated electronegative. The hydracids besides receiving the prefix "hydro," the higher acids of an acid, terminate in "ic," the lower in "ous." Thus, HCl hydrochloric acid,  $\text{H}_2\text{SO}_4$  sulphuric acid,  $\text{H}_2\text{SO}_3$  sulphurous acid.

**What are the names of salts according to the acids used in their formation?**

Hydracids form binary compounds, ending in "ide;" "ic" acids form "ate" salts; "ous" acids form "ite" salts; "hypo" acids form hypo-ites; "per" acids form "per-ates;" thus, hydrochloric acid forms chlorides; sulphuric acid forms sulphates; sulphurous acid forms sulphites; hypochlorous acid forms hypochlorites; perchloric acid forms perchlorates.

**What expresses the basicity of acids and the acidity of bases?**

The basicity of acids depends on their amount of replaceable hydrogen, and the acidity of bases on their number of hydroxyl groups; example,  $\text{HNO}_3$  monobasic acid,  $\text{H}_2\text{SO}_4$  dibasic acid, etc.  $\text{KOH}$  monoacid base,  $\text{Ca(OH)}_2$  diacid base.

**What are normal, acid, basic, and double salts?**

Normal salts, those having neither acid nor basic hydrogen in excess; acid salts, those containing basic hydrogen in excess; basic salts, those having acid hydrogen in excess; double salts, those containing two or more different positive atoms. Thus, normal salt,  $\text{Ca}_3(\text{PO}_4)_2$ ; acid salt,  $\text{NaH}_2\text{PO}_4$ ; basic salt,  $\text{PbOH}(\text{C}_2\text{H}_5\text{O}_2)$ ; double salt,  $\text{NH}_4\text{Mg PO}_4$ .

**What is the ammonia type, and the terms of its compounds?**

The type of compounds formed by substituting the hydrogens of ammonia  $\text{NH}_3$ ; the substitution of H by an electropositive atom or radical forming an "amine;" the substitution of H by an electronegative atom or radical forming an "amide;" while the substitution of an H by an electronegative and another by an electropositive, yields an alkalamide.

**What are the further denominations of amines and amides?**

According to the number of H substituted they may be mono-amines, di-amines, and tri-amines, or mono-amides, di-amides and tri-amides; the names of the electronegative or electropositive atoms or radicals displacing the H, being placed between the Greek numeral and the words amine or amide. If more than one of the  $\text{NH}_3$  group enter into the compound, the substituting radicals are placed before the Greek numeral which are used

according to the number of N left. Thus, ethylamine, di- or tri-ethylamine, mono-di- or tri-acetamide; in the last case, however, carbonyl-di-amide, etc.

**What are the relative volumes of the molecules of all bodies in a gaseous state?**

The volumes of molecules of gases are alike ; or equal volumes, of gases contain equal numbers of molecules.

**How do gases combine?**

Volume for volume when both are monads, two and one when monad and dyad, three and one when monad and triad, etc.

**How many volumes result in all these cases?**

Two volumes or two molecules, if each combining volume is one molecule.

**When one molecule of hydrogen and one molecule of chlorine unite, what is formed?**

Two molecules of HCl.

**What does this prove?**

That, as two molecules of HCl were formed, each contains one atom of H and one of Cl, the molecule of hydrogen and of chlorine contain each two atoms.

**What is stoichiometry?**

The computation of the weights of bodies entering into chemical combinations and their results.

**How are the molecular weights of chemical bodies determined?**

By adding together the atomic weights of the component atoms. Thus  $H_2SO_4$ —

$$2H = 2$$

$$S = 32$$

$$4O = 64$$

$$\text{Total} = 98 = \text{molecular weight of } H_2SO_4.$$

**When  $HNO_3$  unites with  $KOH$ , what results? formula?**

**What does this equation also stand for in weight units?**

$$\frac{1+14+48}{63} + \frac{39+16+1}{56} = \frac{39+14+48}{101} + \frac{2+16}{18}$$

**How may the elements be classified for convenience of study?**

Into metals and non-metals, which are again grouped according to their valences, electro-chemical relations, as well as physical and chemical characters; hydrogen and oxygen are grouped by themselves as typical elements. Thus—

#### NON-METALS.

- Group I. Hydrogen and oxygen.
- Group II. *Electronegative monads*, or *Chlorine group*.  
Fluorine, chlorine, bromine, iodine.
- Group III. *Electronegative dyads*, or *Sulphur group*.  
Sulphur, selenium, tellurium.
- Group IV. *Electronegative triads*, or *Nitrogen group*.  
Nitrogen, phosphorus, arsenic, antimony (bismuth, see metals).
- Group V. Boron.
- Group VI. *Electronegative tetrads* or *Carbon group*.  
Carbon, silicon.

#### METALS.

- Group I. *Alkali metals*.  
Lithium, sodium, potassium, rubidium, caesium (ammonium).
- Group II. *Metals of the alkaline earths*.  
Calcium, strontium, barium.
- Group III. *Magnesium group*.  
Magnesium, beryllium, zinc, cadmium.
- Group IV. *Lead group*.  
Lead, thallium.
- Group V. *Copper group*.  
Copper, silver, mercury.
- Group VI. *Yttrium group*.  
Yttrium, erbium, terbium, ytterbium, scandium, decipium, lanthanum, cerium, didymium.

Group VII. *Aluminium group.*  
Aluminium, indium, gallium.

Group VIII. *Iron group.*  
Manganese, iron, cobalt, nickel.

Group IX. *Chromium group.*  
Chromium, molybdenum, tungsten, uranium.

Group X. *Tin group.*  
Tin, titanium, zirconium, thorium.

Group XI. *Bismuth group.*  
Vanadium, bismuth, tantalum, niobium.

Group XII. *Platinum group.*  
Gold, platinum, palladium, rhodium, iridium,  
ruthenium, osmium.

## Hydrogen.

**What is hydrogen, and what its properties?**

A colorless, odorless, tasteless elementary gas, rarely found free in nature. Symbol H, atomic weight 1, valence<sup>1</sup>, molecular weight 2; one liter at 760 mm. pressure and 0° C. weighs 0.08958 grams = 1 erith. It is combustible, but not a supporter of combustion. A mixture of H and O will explode violently when lighted, forming water.

**How can it be demonstrated that it is lighter than air?**

A balloon or soap-bubble filled with it will rapidly ascend. It can be readily transferred by pouring it from one inverted vessel into another from below upwards, displacing the air in doing so.

**What is its diffusibility?**

It is highly diffusible, penetrating through porous bodies with ease, and diffusing through membranes.

**Is hydrogen under all circumstances and conditions a gaseous body?**

It can be reduced to the liquid state by cooling to -140° C., and under a pressure of 600 atmospheres. It then resembles a steel-blue, non-transparent fluid, somewhat like mercury, and upon evaporation even solidifies.

**How can the formation of water by the union of H and O be proven?**

If a flame of hydrogen is allowed to burn in a cool glass cylinder, this will soon be found covered with dew.

**How can hydrogen be prepared?**

By electrolysis of water, by the action of some metals on water, and by the action of zinc or iron on sulphuric or hydrochloric acid.

**What is the result of the electrolysis of water in the Hoffmann's tubes, and how is the presence of H proven?**

When acidulated water is subjected to electrolysis, the H will accumulate in the tube containing the negative electrode, the O

in that containing the positive electrode. There will be besides a definite relation between the volumes of the two gases so liberated, that of H being twice that of O, showing the composition of water as H<sub>2</sub>O. The presence of H can be proven by collecting the gas in a test tube, and burning it, water resulting.

**How can hydrogen be prepared from water by the action of metallic potassium or sodium?**

Sodium or potassium, by superior chemical attraction for oxygen, displaces at ordinary temperature one H, and unites with the residuary H<sub>2</sub>O, as per following formula :—

**Can other metals produce the same result?**

Iron at red heat will do the same, uniting with O and liberating H.

**What is the most common process for obtaining hydrogen for experimental purposes?**

The action of zinc or iron on sulphuric or hydrochloric acid, the metal replacing the H of the acid and setting this free to be collected, as per following formula :—

**What other process is employed for obtaining H in Fleitmann's test?**

The action of aluminium metal on sodium- or potassium-hydrate at ordinary temperature, or that of zinc at the boiling point, as follows : Al+3KOH=K<sub>2</sub>AlO<sub>3</sub>+3H.

**For what purposes is hydrogen in its nascent state used in chemistry?**

As a reducing agent, *i. e.*, to take away from and unite with the oxygen of other bodies.

**What is the physiological effect of inhaling hydrogen, and why?**

It produces a higher pitch of the voice on account of the more rapid vibrations of the vocal cords in a less dense atmosphere.

## Oxygen.

**What is oxygen? Its properties?**

A colorless, odorless, tasteless, elementary gas. Symbol, O, a. w. 16, valence<sup>II</sup>, m. w. 32; one litre weighing at 0° C. and 760 mm. 143 grams. It is liquefied at -130° C. and 470 atmospheres pressure; it is slightly soluble in water (about 3 per cent. at 15° C.). It is a supporter of combustion, but not combustible. It unites with all the elements excepting fluorine, forming with them compounds termed "oxides."

**What is the process termed when oxygen unites with another element, and amidst what phenomena does it usually take place?**

Oxidation, which, if it takes place rapidly, is generally accompanied by development of heat and light, and is then termed combustion.

**Where is oxygen found, and in about what proportions?**

It is the most abundant element in nature, existing free in the atmosphere, and in combination with other elements; it composes about two-thirds of the entire globe.

**How may oxygen be prepared?**

By heating mercuric oxide to a high temperature it is decomposed into mercury and oxygen.  $HgO = Hg + O$ .

**How is it prepared from potassium chlorate?**

By heating the coarsely powdered  $KClO_3$  and collecting the escaping gas; as this gives rise to irregular and violent evolution of the gas, about one-fourth of its weight of powdered manganese dioxide is mixed with it, which causes the more even liberation of the gas and at a lower temperature; the manganese dioxide, however, takes no chemical part in the process.  
 $2KClO_3 = 2KCl + 3O_2$ .

**In what other processes is oxygen liberated?**

In the electrolysis of water, also by the action of sunlight upon the leaves of plants.

**What takes place if a piece of magnesium wire is ignited, and what is the product?**

It deflagrates, emitting a very bright light, leaving as a white ash the magnesium oxide.

**If a glowing charcoal ember, ignited sulphur, phosphorus, or a heated steel wire, is immersed in a jar containing oxygen what takes place, and what are the results?**

They deflagrate rapidly, giving rise to heat and light, leaving as results the oxides of the different substances used. The carbon produces  $\text{CO}_2$ , the sulphur  $\text{SO}_2$ , the phosphorus  $\text{P}_2\text{O}_5$ , the iron  $\text{Fe}_2\text{O}_3$ .

**What is the oxy-hydrogen flame, and how applied to the lime light?**

A flame produced from burning oxygen and hydrogen from a special burner. It is not luminous but very hot, melting even platinum, etc. By exposing to it a piece of lime, this becomes incandescent, and emits a bright white light.

**Is slow oxidation, such as the rusting of iron in the air, different in its result from rapid oxidation or combustion?**

They are identical processes and yield the same results : the heat given off in rapid combustion is also given off, but apparently insensibly, in the slow oxidation.

**What chemical process is going on in the burning of coal oil, candles, etc.?**

An oxidation of their component parts ; their carbon forming carbon dioxide  $\text{CO}_2$ , and their hydrogen water  $\text{H}_2\text{O}$ .

**What is the part oxygen takes in the physiological process ?**

It is carried by the haemoglobin of the red blood corpuscles to the tissues, where it unites with their carbon and hydrogen, forming carbon dioxide and water : the former of these as a waste product is given off by the lungs ; the heat liberated by this oxidation produces either animal heat or is converted into the other physiological forces.

**Why are inhalations of oxygen of no benefit in the treatment of disease?**

Because the corpuscles cannot take up more or in a different dilution than formed in the atmospheric air. It is proven that animals when kept in an atmosphere of oxygen, do not exhale more CO<sub>2</sub> than when kept in air.

### Ozone.

**What is ozone? Its properties?**

Condensed oxygen; triatomic molecules of oxygen, O<sub>3</sub>, of a density of 24 (III), m. w. 48. It possesses a penetrating chlorine odor and a bluish color; it is coercible at high pressure and low temperature yielding drops of indigo blue color. At 300° C. it becomes diatomic oxygen. It is chemically very active, oxidizing other bodies readily and bleaching organic coloring matter; it is absorbed without change by oil of turpentine and other essential oils.

**What may ozone also be said to be?**

An allotropic form of oxygen, *i. e.*, a substance which, though qualitatively of the same elementary composition, has different physical and chemical properties, owing to the difference of its molecular structure.

**How is ozone prepared?**

1. It forms when phosphorus is exposed to moist air or oxygen. 2. By the addition of small quantities of potassium permanganate or barium peroxide to cold sulphuric acid. 3. By an electric discharge through the air or oxygen.

**How is it best prepared?**

By the silent discharge of a powerful current from a Ruhmkorff coil through a Siemen's induction tube, through which freshly prepared oxygen is allowed to flow.

**How is ozone recognized?**

By its action on potassium iodide starch paper; as it decomposes the KI into K and I, the I turns the starch blue. Tinetur of guaiacum is turned blue and lead acetate brown by O<sub>3</sub>.

Hydrogen peroxide answers the same test, but O<sub>3</sub> in addition blackens bright strips of silver.

**What influence has ozone on epidemic diseases ?**

It is said to arrest them by oxidizing the organic material giving rise to them.

**When and where is ozone found ?**

It is found in the air, especially after thunder storms, and abounds in high latitudes, the seashore, etc.

**What is the effect of inhaling air rich with ozone on the respiratory organs ?**

It irritates them, causing coryza and even haemoptysis.

**Compounds of Hydrogen and Oxygen.**

**Water.**

**How can the composition of water be proven ?**

By analysis and synthesis.

**What is analysis and what synthesis ? how can they be applied to water ?**

Analysis means the decomposition of a molecule into its component atoms, and synthesis the recombination of the constituent atoms to form the molecule. Electrolysis effects the analysis of H<sub>2</sub>O into 2H and 1O ; and if two volumes of H and one of O are mixed, and united by an electric spark passing through them, water is formed.

**What is water ? Its properties ?**

A compound of H and O ; formula H<sub>2</sub>O, m. w. 18, density 9, sp. gr. 1 ; solidifies at 0° C. ; boils at 100° C. It is a limpid, colorless, odorless, and tasteless liquid. Its maximum density is at 4° C = 39, 2° F., at which point its liter weighs 1000 grams. It is a poor conductor of heat and electricity. At 0° C. it solidifies, and is then known as ice ; at 100° C. it boils and assumes a gaseous form, known as steam. Its solvent powers are very great.

**What are the chemical properties of H<sub>2</sub>O ?**

It is chemically very active, uniting with the oxides of the

electropositives to form bases ( $\text{CaO} + \text{H}_2\text{O} = \text{Ca(OH)}_2$ ), and with the oxides of electronegatives to form acids ( $\text{CO}_2 + \text{H}_2\text{O} = \text{H}_2\text{CO}_3$ ).

**How may water influence the molecular structure of crystalline bodies?**

It enters into the molecular structure of many crystalline bodies without forming a chemical part thereof; when this is given up by them spontaneously they are termed *efflorescent*, and when they attract more from the atmosphere and liquefy, they are called *deliquescent*. When containing no  $\text{H}_2\text{O}$  molecule, a body is called *anhydrous*.

**What is distillation, what sublimation, and what distilled water?**

Distillation means the volatilization of liquids, condensing and recovering their vapors in special apparatus. Sublimation is the same process applied to volatile solid bodies. Distilled water is the water purified by the former method for chemical and other purposes; it is however not absolutely pure.

**Define the term potable, hard, temporary-hard, permanently-hard, and soft water.**

Potable is water when suitable for drinking purposes; hard is water when it contains calcium or magnesium salts, and does not lather with soap; when it contains the carbonates of calcium or magnesium in solution and removable by boiling, it is temporarily hard; when the hardness is due to other soluble salts of Ca or Mg not removable by boiling, it is permanently hard. Soft water contains little or no mineral salts in solution.

**What is the purest natural water, and what does it usually contain?**

Rain- or snow-water, if not contaminated in collecting; it contains little solid matter, except traces of ammonium nitrite and nitrate, but some oxygen, nitrogen, and carbon dioxide in solution.

**What is the principal contamination to guard against in rain-water for potable purposes?**

Lead from roofs or pipes, as the nitric and nitrous acids, as well as nitrates, render soluble compounds with lead.

**Which waters contain, besides solid ingredients, notable quantities of organic material?**

River waters, especially those draining marshes or running sluggishly through marshy bottoms.

**Is organic material admixed to water always deleterious, and when is it?**

In itself organic material is not injurious, but as it is a soil for disease germs it is objectionable; when it arises from draining off animal exereta it may contain disease germs which render it dangerous to health. Thus sewage contamination of water is apt to contain germs which can proliferate in organic material, and breed disease.

**What other admixture is found in river water, and of what importance is it?**

Rivers running through alluvial soil may through freshets also contain in their waters suspended matter, which, when of mineral origin, is of no especial significance, but if it arises from organic source may become dangerous to health.

**How may river water be purified?**

By storage and sedimentation, allowing undissolved mineral and organic matter to be deposited; by aeration, so that oxygen of the atmosphere oxidizes the organic matter; by filtration, restraining undissolved particles by interposed gravel beds; finally, by dilution from additional pure sources into its course.

**What precaution should be observed in selecting a water supply from rivers?**

To select the source of supply sufficiently far away from large cities, and as far as possible below any places of habitation or factories emptying their refuse into it.

**What objection is there to well-water?**

That it contains surface water drained from cesspools, and that it is impregnated with both organic and inorganic material. The deeper the wells are, the danger from this source diminishes.

**What are deep and artesian wells, and the character of their water?**

Wells sunk through impermeable strata, receiving their water from large distances, or from the underground flow of rivers. Their water is usually free from organic material, but abundant with mineral ingredients.

**What are the source and character of spring-water?**

Springs generally receive their supply from rain-water which has filtered into deeper strata, and has found its outlet below its original level. It is generally cool and fresh, containing little organic matter, but abundant mineral material.

**What may indicate sewage contamination of water, and what amount thereof is permissible in potable water?**

Sodium chloride and other chlorides may indicate sewage contaminations, but are no evidence thereof. Potable water should not contain more than two grains of it to the gallon. If more, the character and amount of organic material should be determined.

**Is there any chemical process giving the amount of organic material contained in water?**

No ; the organic material in water can only be arrived at comparatively by either converting it by an alkaline potassium permanganate solution into ammonia, and determining this with the Nessler's test, or by determining how much potassium permanganate solution is necessary to oxidize it, and comparing this with the amount of oxalic acid necessary to the same end.

**What process may be employed to determine the amount of organic material?**

The biological test in which sterilized gelatine solution is inoculated with the water to be tested : the number of colonies of bacteria developed are then counted and compared with those developed from known pure water.

**How is the amount of chlorides in water determined?**

By testing the water either directly or after concentration with a volumetric solution of silver nitrate, using potassium chromate as an indicator.

**How is this done?**

One hundred c.c. of the water are placed in a beaker glass, a few drops of the potassium chromate solution are added to render it yellowish. The mixture is rendered slightly alkaline, and then from a burette the silver nitrate solution (4.79 grams per liter) is dropped into it until the water turns faintly orange-red. Each c.c. of the silver solution so used represents 0.001 chlorine in 100 water or 0.01 in the liter.

**What does the presence of nitrites in water indicate?**

The decomposition of organic nitrogenized material, and any other but rain-water, containing them, should be regarded with suspicion.

**How can small amounts of nitrites in water be readily detected?**

By adding to it a solution of diphenylamine in pure strong sulphuric acid. If nitrites are present a blue color will be developed. Also by adding to the water to be examined a few drops of  $H_2SO_4$  and then some starch-water, and lastly a few drops of KI solution. If the starch turns blue nitrites are present.

**What is indicated by detecting in water an excess of chlorides and also nitrites?**

That it is contaminated with sewage.

**Is an excess of chlorides alone, without organic admixture, or of nitrites alone without chlorides sufficient to condemn a water?**

No, as water may, for instance near the ocean, contain a greater amount of chlorides, and rain-water generally contains nitrites.

**What are the best means for purifying water?**

Filtration to remove suspended matter and boiling; because this destroys the disease germs and corrects temporary hardness.

**How is water tested for lead?**

By evaporating a certain amount, treating the residue with  $HNO_3$ , evaporating the excess of  $HNO_3$ , dissolving the residue in a little distilled water and passing through it a current of hydro-

gen sulphide. If lead is present (other metals of this group being excluded), a brownish-black precipitate will be noticed ; when lead exists in notable quantities, the water may be tested direct by hydrogen sulphide or an addition of ammonium sulphhydrate.

### **What are carbonated, alkaline, chalybeate, saline, and sulphur waters?**

Waters having special ingredients which meet therapeutic indications. Those containing an excess of carbon dioxide are termed carbonated, others holding in solution the carbonates of the alkalies are called alkaline ; saline waters those containing neutral salts in serviceable quantities ; while the waters containing hydrogen sulphide or alkaline sulphides in solution are sulphur waters, and when iron is contained in them they are called chalybeate.

### **What is hydrogen peroxide? Its properties?**

A colorless syrupy liquid, sp. gr. 1.45, formula  $H_2O_2$ , m. w. 34. It is a powerful bleacher and deodorizer, unstable when concentrated, less so when in dilute solutions (commercial 1-10). In decomposition it gives off nascent oxygen.

### **How is it prepared?**

By decomposing barium peroxide with sulphuric acid or carbonic acid.

## **Electronegative Monads—Halogens.**

### **What elements belong to this group?**

Chlorine, bromine, iodine, fluorine.

### **Why are they also called halogens?**

Because they are *salt producers*, i. e., they produce with the metals salt-like derivatives.

## Chlorine.

### What is chlorine?

A yellowish-green elementary gas of suffocating odor, symbol, Cl, a.w. 35.37, m.w. 70 : 1 liter weighs 3.17 grams. Sp. gr. 2.46.

### What are its physical properties?

It is coecible at 15° C. and 4 atmospheres pressure; freely soluble in water, 1 volume at 20° C. taking up two volumes Cl; this solution being known as chlorine water; this forms crystals of chlorine hydrate ( $\text{Cl}_2 + 10 \text{H}_2\text{O}$ ), below 0° C., but decomposes into its constituents at ordinary temperature.

### Give its principal chemical properties.

It has a great affinity for almost all elements forming chlorides with them. This often takes place amidst heat and light phenomena, as when Dutch metal leaf or powdered antimony is thrown into the dry gas. It decomposes with water and other hydrogen compounds into HCl and O. It decolorizes indigo and litmus solutions, also other organic colors when moist, by liberating nascent O, and also destroys organic germs in this manner.

### What is meant by nascent O and by nascent state?

Nascent O means O at the moment of liberation before it assumes its free or molecular state. The nascent state of bodies really implies their atomic or also unsaturated state.

### Is chlorine combustible or a supporter of combustion, and what occurs when a burning candle is immersed in chlorine?

It is not combustible but a supporter of combustion; a burning candle will continue to burn in it, giving off dense volumes of carbon.

### How is chlorine prepared?

By heating a mixture of manganese dioxide with hydrochloric acid or with the materials forming this latter, namely, chloride of sodium and sulphuric acid.

**Explain the former process by equation and also the latter.**

Manganous chloride being formed which dissolves in the water. The other process depends upon the formation of hydrochloric acid and the decomposition of this by the manganese dioxide :

**What is the compound of chlorine and hydrogen ?**

Hydrogen chloride or hydrochloric acid, formula HCl, m. w. 36.37, a colorless gas, sp. gr. 1.26, of pungent odor, fuming in the air, irritates the air passages, very soluble in water, 1 volume dissolving 450 volumes at 15° C., the solution being known as hydrochloric or muriatic acid.

**What is the acidum hydrochloricum U. S. and what acidum hydrochloricum dilutum U. S.?**

The former is a colorless solution of pure HCl in water, sp. gr. 1.16; the latter is the further dilution of the stronger to the sp. gr. 1.049, containing 10 per cent. HCl.

**What are the tests for the recognition of HCl?**

Its vapors redden moist litmus paper, and give dense white vapors with ammonia.

**What are further tests for HCl and soluble chlorides?**

They give white, curdy precipitates with silver nitrate, which are soluble in ammonium hydrate.

**Does free hydrochloric acid exist in the body, and where?**

Yes ; in the gastric juice.

**What is the character of the stain on textiles by hydrochloric acid?**

Dark textiles are generally stained red by it ; the stain is evanescent and readily removed by ammonium hydrate.

**State in brief its poisonous action.**

Its action on the tissues is that of a corrosive, producing extreme laryngeal irritation, even œdema and consequent asphyxia, black eschars on tongue and pharynx, corrosion and possibly perforation of œsophagus and stomach, and even in absence of this, it may cause subsequently inanition from destruction of mucous surfaces or stricture of the œsophagus.

**What are the antidotes for poisoning by HCl?**

Alkaline carbonates in dilute solutions, alkaline earths, magnesia, and soap-suds.

**What class of poisons does it belong to, which are the principal ones of this class, and what is the mode of their toxic action?**

It belongs to the corrosive acids, the principal ones of which are sulphuric, nitric, and hydrochloric acid; they act by the destruction of the tissue they come in contact with, but not by absorption.

**How is the strength of acids quantitatively determined, and upon what is this process based?**

By *acidimetry*, wherein the acids are neutralized by alkaline solutions of known strength, termed volumetric solutions.

**How are the volumetric solutions of KOH and NaOH prepared?**

By making solutions of these alkalies and standardizing them with a normal solution of oxalic acid, which contains as many grams of the latter in a liter of distilled water as one-half of its molecular weight. The alkaline solution must be made of such strength as to neutralize exactly the oxalic acid solution volume for volume.

**How is the process of acidimetry performed?**

A certain amount, say 10 c.c., of the solution to be tested is placed in a beaker glass, diluted, and to it are added a few drops of red litmus solution as an indicator; then the volumetric alkaline solution is dropped into the former until the change of color of the litmus to a violet indicates the neutralization. The result of the neutralization is then computed either by stoichio-

metric proportion or by reference to already computed tables. When the acidity of mixed acids is wanted this is expressed in comparative amounts of oxalic acid.

**Which are the oxygen compounds of chlorine?**

$\text{Cl}_2\text{O}$  hypochlorous oxide or hypochlorous anhydride.

$\text{Cl}_2\text{O}_3$  chlorous oxide or chlorous anhydride.

$\text{Cl}_2\text{O}_5$  chloric oxide or chloric anhydride.

$\text{Cl}_2\text{O}_7$  perchloric oxide or perchloric anhydride.

**What do they form with water respectively?**

$\text{Cl}_2\text{O} + \text{H}_2\text{O} = 2\text{HClO}$  hypochlorous acid.

$\text{Cl}_2\text{O}_3 + \text{H}_2\text{O} = 2\text{HClO}_2$  chlorous acid.

$\text{Cl}_2\text{O}_5 + \text{H}_2\text{O} = 2\text{HClO}_3$  chloric acid.

$\text{Cl}_2\text{O}_7 + \text{H}_2\text{O} = 2\text{HClO}_4$  perchloric acid.

**Are these compounds stable? In what form are they principally found, and what are those of medical interest?**

They are unstable, and are generally found as salts of the acids, of which the hypochlorite of calcium  $\text{Ca}(\text{ClO})_2$ , hypochlorite of sodium  $\text{NaClO}$ , and the potassium chlorate  $\text{KClO}_3$ , are of importance in medicine.

**In what substance is calcium hypochlorite contained, and with what other substance? How prepared?**

In calx chlorata, chlorinated lime, also called chloride of lime, commonly known as bleaching powder, which consists of a mixture of calcium chloride  $\text{CaCl}_2$  and calcium hypochlorite  $\text{Ca}(\text{ClO})_2$ . It is prepared by saturating slaked lime with chlorine gas.

**What preparation depends upon the presence of sodium hypochlorite for its efficacy?**

The liquor sodæ chloratæ or chlorinatæ, otherwise known as Labarraque's solution. It is prepared by decomposing a saturated solution of chlorinated lime with a solution of sodium carbonate, the latter being in excess. It is a powerful disinfectant, as, in its decomposition, it gives rise not alone to chlorine, but to nascent O also.

## Bromine.

### What is bromine? Its physical properties?

An elementary liquid, of dark reddish-brown color, and disagreeable odor. Symbol Br, a. w. 80; sp. gr. 3.18 at 0° C.; it crystallizes at -7.3° C.; boils at 63°, giving rise to yellowish-brown vapors; at a lower temperature the vapors are dark-brown; one part of it at 15° C. dissolves in 39 Aq. It is soluble in alcohol, but more so in ether, chloroform, and carbon bisulphide.

### What are its chemical properties?

Very much like those of chlorine, but less active, bleaching like it, but in a less degree. It colors starch yellow.

### When and how does bromine occur in nature?

In sea-water and in saline springs, termed bitters, as bromides.

### How is bromine prepared?

Like chlorine, by warming a mixture of manganese dioxide, and sodium bromide with sulphuric acid.

### What is the hydrogen compound of bromine?

Hydrogen bromide or hydrobromic acid HBr.

### How is HBr made? Its properties?

By decomposing Br in H<sub>2</sub>O with hydrogen sulphide, as follows: Br<sub>2</sub> + H<sub>2</sub>O + H<sub>2</sub>S = H<sub>2</sub>O + S + 2HBr; also by decomposition of a bromide with sulphuric acid. It is a colorless gas fuming on contact with the air.

### What is strong and what diluted hydrobromic acid?

The strong is a concentrated solution of gaseous HBr in water, which when diluted to contain 10 per cent. HBr, sp. gr. 1.044, constitutes acidum hydrobromicum dilutum of the Pharmacopœia.

### Which of the oxyacids of Br are used, and in what form?

The hypobromous acid HBrO, as sodium hypobromite in the Knop's solution for determining urea, *q. v.*

### Iodine.

#### What is iodine? Its physical properties?

A crystalline, elementary body of metallic lustre. Symbol I, a. w. 127; sp. gr. 4.95; fusing at 113° C. to a liquid, and boiling at 200° C., giving off dark-violet vapors. It is slightly soluble in water, more readily in alcohol; in this form, when of officinal strength, it is the *tinctura iodi*; it is readily soluble in ether, chloroform, and carbon disulphide, in the last two with violet color; potassium iodide favors its solution in water.

#### Give its chemical properties.

These are similar to chlorine and bromine, but weaker; it imparts a blue color to starch.

#### Where does iodine occur in nature, and how is it prepared?

It occurs in mineral springs and sea-water. Seaweed contains it, and when burned is known as kelp, from which it is manufactured by a similar process to that employed for chlorine and bromine; the magnesium iodide and sodium iodide being mixed with manganese dioxide and warmed with  $H_2SO_4$ .

#### What is the hydrogen compound of iodine?

Hydrogen iodide or hydriodic acid HI, a colorless gas, which is very soluble in water; prepared similarly as hydrobromic acid, by treating iodine in water with hydrogen sulphide. It enters into the syrups acidi hydriodici of the Pharmacopœia.

### Fluorine.

#### What is fluorine, and its properties?

Probably an elementary gas. Symbol Fl, a. w. 19. Of such strong affinity for almost all substances, that it cannot be obtained free.

#### What is its principal compound, and from what is this obtained?

Its principal compound is hydrogen fluoride HFl, or hydroflu-

ric acid ; it is obtained by the action of warm sulphuric acid on fluor-spar, the calcium fluoride ;  $\text{CaF}_2 + \text{H}_2\text{SO}_4 = \text{CaSO}_4 + 2\text{HF}$ .

**What are the properties of hydrofluoric acid ? Is fluorine found in the human economy, and where ?**

The aqueous solution of the gaseous hydrofluoric acid is a colorless liquid, very corrosive, and attacking the tissues severely. It also attacks glass, and is used for etching it. Fluorine, as fluoride of calcium, is found in the enamel of teeth and in the bones.

### Electronegative Dyads.

**Which elements compose this group ?**

Sulphur, selenium, and tellurium (properly oxygen also).

#### Sulphur.

**What is sulphur ?**

A solid elementary body, capable of existing in several allotropic conditions. Symbol S<sup>II</sup> IV VI, a. w. 32.

**State the different systems of crystallization, and their characteristics.**

1. The regular or tesselar system, the crystals of which have three axes of equal length, intersecting each other at right angles.

2. The quadratic or tetragonal system, the crystals of which have one longer and two shorter axes ; the latter of equal length and all intersect each other at right angles.

3. The hexagonal or rhombohedral system ; the crystals of this system have four axes, three of equal length, which intersect each other in one plane at angles of  $60^\circ$  ; the fourth, a longer axis, intersects their plane at  $90^\circ$ .

4. The rhombic system, the crystals of which are all of unequal length, and intersect each other at  $90^\circ$ .

5. The monoclinic system ; its crystals have three unequal axes ; two of which intersect at  $90^\circ$  ; the third intersects one at  $90^\circ$ , and the other obliquely.

6. The triclinic system comprises the crystals which have three unequal axes, all obliquely inclined to each other.

**What is the physical structure of the different allotropic conditions of sulphur, and how is their occurrence accounted for?**

1st, ordinary octahedral or rhombic sulphur, sp. gr. 2.05 ; 2d, prismatic or monoclinic sulphur, sp. gr. 1.98 ; 3d, soft, plastic sulphur, sp. gr. 1.95. These different modifications may be accounted for by the presence of varying numbers of atoms in their molecules.

**What is the effect of different degrees of heat on sulphur?**

It melts at 115° C. as a pale yellow liquid ; between 200° and 250° C. it becomes viscid ; above that it becomes fluid again and boils at 440° C.

**In what different forms does sulphur come in commerce ?**

Roll sulphur, sublimed sulphur, which, when washed free from adhering acids, is termed sulphur lotum ; precipitated or lac sulphuris.

**Where and how does sulphur occur in nature ?**

It is found free in volcanic regions ; also as compounds with many metals as well as in organic substances.

**How does sulphur behave chemically ?**

Similar to oxygen, forming binary compounds with most of the metals, burning in the air with bluish flame to form sulphur dioxide  $\text{SO}_2$ , and it may also exhibit linking powers like oxygen.

**What is the hydrogen compound of sulphur ? Its properties ?**

Hydrogen sulphide, also termed sulphuretted hydrogen,  $\text{H}_2\text{S}$  ; a gaseous colorless body of the odor of rotten eggs, sp. gr. 1.177, and cohereable ; soluble 3-4 volumes in 1 of water. It is combustible, weakly acid, and poisonous.

**How is  $\text{H}_2\text{S}$  prepared ?**

By the action of  $\text{H}_2\text{SO}_4$  on ferrous sulphide  $\text{FeS}$ .

**How is ferrous sulphide made?**

By fusing together iron filings and sulphur.

**What does H<sub>2</sub>S form with metals?**

Metallic sulphides.

**Does H<sub>2</sub>S occur in the body? Where and how does it form?**

It occurs in the body from decomposition of albuminous food in the flatus; from the tartar of the teeth and from decay of food between them; it gives rise to the blue line on the gums in lead poisoning.

**How does H<sub>2</sub>S act as a poison?**

By combining with and reducing the haemoglobin.

**Where does it occur, and what symptoms does it give rise to when inhaled for some time?**

In sewer gas, the inhalation of which for some time gives rise to giddiness, headaches, and low fevers.

**What are the antidotes for H<sub>2</sub>S poisoning?**

Stimulants, fresh air, and chlorine.

**What are the tests for H<sub>2</sub>S?**

Its characteristic odor and moist lead acetate paper, by which 1 in 10,000 can be detected.

**What are the principal oxygen compounds of sulphur?**

Sulphur dioxide, sulphurous oxide S<sub>0</sub><sub>2</sub>, and sulphur trioxide, sulphuric oxide S<sub>0</sub><sub>3</sub>.

**What is sulphur dioxide and its principal properties?**

A colorless gas of pungent suffocating odor, S<sub>0</sub><sub>2</sub>, m. w. 64, sp. gr. 2.247; coercible at -15° C. or at ordinary temperature, and two atmospheres of pressure, crystallizing at -76° C.; 50 volumes soluble in 1 volume water; neither a supporter of combustion nor combustible.

**What are its principal chemical properties?**

It unites with H<sub>2</sub>O to form sulphurous acid, H<sub>2</sub>SO<sub>3</sub>; is a reducing agent, *i. e.*, has great affinity for oxygen.

**What is the sulphurous acid U. S.?**

A solution of  $H_2SO_3$  in water, of the characteristic odor of burning sulphur, sp. gr. 1.022-1.023, and of strongly acid reaction.

**For what purposes is  $SO_2$  employed, and how?**

To put out fires, bleach, reduce oxygen compounds, and as a germicide. For disinfecting purposes sulphur is burned in a closed room ; about 2 pounds are used for 1000 cubic feet of floor room.

**How is  $SO_2$  prepared?**

By burning sulphur in oxygen or in atmospheric air,  $S_2 + O_4 = 2SO_2$ , also by the action of  $H_2SO_4$  either on copper or charcoal, sulphur dioxide being liberated, and in the latter process also  $CO_2$ .

**What is sulphuric oxide or sulphur trioxide?**

A white solid, crystallizing in silky needles  $SO_3$ , which unites with  $H_2O$  to form  $H_2SO_4$  ; it has no acid properties.

**What is sulphuric acid?**

A dense colorless, inodorous, corrosive liquid  $H_2SO_4$ , m. w. 98, sp. gr. 1.84, containing not less than 96 per cent.  $H_2SO_4$ . The acidum sulphuricum dilutum U. S. contains 10 per cent.  $H_2SO_4$ , sp. gr. 1.067. The commercial  $H_2SO_4$  is known as oil of vitriol.

**State some of the principal properties of  $H_2SO_4$ .**

It is a dibasic acid forming two salts with monad metals, which if H is present are termed acid, or if two metallic atoms normal salts. It has a great attraction for water, evolving heat when mixed with it ; on this account it is used for drying gases and precipitates.

**Give in brief the process for the manufacture of  $H_2SO_4$ .**

This may be stated as taking place in four stages.

1. The formation of sulphur dioxide by burning sulphur or pyrites with access of air.  $S + O_2 = SO_2$ .

2. Generating nitrogen tetroxide  $\text{N}_2\text{O}_4$ , which gives off oxygen to the  $\text{SO}_2$  forming  $\text{SO}_3$  and  $\text{N}_2\text{O}_2$ ,

3. The  $\text{SO}_3$  is mixed with aqueous vapor resulting in the formation of  $\text{H}_2\text{SO}_4$ ,

While, 4th, the  $\text{N}_2\text{O}_2$  is reoxidized by contact with the oxygen of the air,

and can be used again as before, the whole of the process being conducted in leaden chambers ; the resulting liquid is condensed to the proper specific gravity.

**What class of poisons does  $\text{H}_2\text{SO}_4$  belong to, and what are the symptoms caused by it ?**

It belongs to the corrosive mineral acids, causing white eschars on tongue, lips, and pharynx, possibly œdema of larynx and perforation of stomach, and, if not, the patient may die of inanition eventually.

**What are the antidotes for poisoning by sulphuric acid ?**

Magnesia, alkaline carbonates, soap-suds, also eggs and milk.

**What are the tests for sulphuric acid ?**

Red stains on dark textiles, disappearing on application of ammonium hydrate.  $\text{H}_2\text{SO}_4$  and the soluble sulphates give dense white precipitates with barium chloride or nitrate ; when concentrated down  $\text{H}_2\text{SO}_4$  will char the carbohydrates. Paper moistened with a diluted  $\text{H}_2\text{SO}_4$ , and the water evaporated by gentle heat will char. Concentrated  $\text{H}_2\text{SO}_4$  heated with copper slips will liberate vapors of sulphur dioxide.

**What is hyposulphurous acid, and what is sodium hyposulphite ?**

Hyposulphurous acid  $\text{H}_2\text{S}_2\text{O}_3$ , an unstable compound ; the so-called sodium hyposulphite  $\text{Na}_2\text{S}_2\text{O}_3$  is really not a hyposulphite but a thiosulphate.

**What is Nordhausen or fuming sulphuric acid ?**

A thick, oily, fuming liquid, sp. gr. 1.85-1.9, sometimes called disulphuric acid, because its formula may be obtained from two molecules of  $\text{H}_2\text{SO}_4$  by the subtraction of  $\text{H}_2\text{O}$ ;  $2\text{H}_2\text{SO}_4 - \text{H}_2\text{O} = \text{H}_2\text{S}_2\text{O}_7$ . It splits up by heat into  $\text{H}_2\text{SO}_4$  and  $\text{SO}_3$ , so that it may be considered a solution of  $\text{SO}_3$  in  $\text{H}_2\text{SO}_4$ . It dissolves indigo.

**Electronegative Triads or Nitrogen Group.****Which elements belong to this group ?**

Nitrogen, phosphorus, arsenic, antimony, bismuth.

**Nitrogen.****What is nitrogen ?**

An elementary gas, symbol  $\text{N}^{\text{i}}$   $\text{m}^{\text{v}}$ , a. w. 14, sp. gr. 0.971; one liter weighs 1.25 grams.

**What is it also called, and where does it occur free ?**

It is also called azote, and occurs free in the atmosphere, of which it constitutes about four-fifths.

**Give the properties of N.**

It is colorless, odorless, tasteless; coercible only at  $-130^{\circ}\text{C}$ . and 280 atmospheres; it is neither combustible nor a supporter of combustion; it combines directly with very few substances; it extinguishes flames and life when immersed in it.

**How can nitrogen be prepared ?**

By isolating it from the air by burning phosphorus in a closed vessel; also by decomposing ammonium nitrite by heat as follows:—

**What is the atmosphere ?**

A gaseous envelope surrounding the earth, composed of a mechanical mixture of oxygen by volume 20.8 and nitrogen 79.2 in 100 volumes. It contains, besides a little  $\text{CO}_2$ , some aqueous

vapor, also traces of  $\text{NH}_3$ ,  $\text{CH}_4$ ,  $\text{H}_2\text{S}$ ,  $\text{SO}_2$ ; the proportions of N and O are very constant.

**State the probable height of the atmosphere and the pressure exerted by it on the square inch.**

The height of the atmosphere has been variously computed from 50-150 miles. It exerts a pressure of 15 pounds to the square inch.

**How can atmospheric pressure be demonstrated?**

By filling a glass tube over 30 inches in length with mercury and reversing it while immersed in a vessel of mercury; the column of mercury in the tube will at once fall to about 30 inches or 760 millimetres; this column is counterpoised by the atmosphere, and there will be a vacuum above it.

**What instruments are based upon this, and how are they constructed?**

Barometers for measuring atmospheric pressure. They are glass tubes closed at the top and ending in a cistern or syphon of mercury. They have attached to the tube a scale for measuring the height of the column of mercury.

**State the cause of variable atmospheric pressure.**

Storms, changes in the meteorological condition, and increased or decreased altitudes.

**How does atmospheric pressure affect the volume of gases?**

Greater pressure diminishes their volume and diminished pressure increases it.

**What other factors influence the volume of gases, and how?**

Heat increases their volume, cold diminishes it.

**What has to be done to compare volumes of gases, and how is this done?**

They have to be reduced to a common standard at 0° C. and 760 mm. pressure. This can be accomplished by the following formula :—

$$V = \frac{v \cdot p.}{760(1+0.00366 t.)}$$

V stands for the volume wanted at 0° C. and .760 mm. pressure; v. for the observed volume; p. for observed pressure; t. for observed temperature, while 0.00366 is the coefficient for the ratio of expansion of gases by heat.

### **What is the compound of nitrogen and hydrogen?**

Ammonia NH<sub>3</sub>, m. w. 17; one liter weighs 0.762 grams.

### **Give the principal properties of ammonia.**

It is a colorless gas of pungent odor, sp. gr. 0.59, coercible at 6.5 atmospheres pressure at 10° C. or without pressure at -40° C.; one volume of water absorbs at 0° C. 760 mm., 1050 volumes NH<sub>3</sub>; it is not combustible nor a supporter of combustion. It unites with acids directly forming pentad nitrogen compounds.  
*See Ammonium.*

### **How is NH<sub>3</sub> obtained, and how prepared?**

It is obtained free from the ammoniacal liquor of gasworks, and may be prepared by the action of quicklime CaO on ammonium chloride NH<sub>4</sub>Cl.

### **Give the names and formulæ of the oxygen compounds of nitrogen.**

Nitrogen monoxide N<sub>2</sub>O, a colorless gas.

Nitrogen dioxide N<sub>2</sub>O<sub>2</sub>, a colorless gas turning red with O or atmospheric air.

Nitrogen trioxide, nitrous anhydride N<sub>2</sub>O<sub>3</sub>, a dark blue liquid.

Nitrogen tetroxide N<sub>2</sub>O<sub>4</sub>, a yellowish-brown liquid or gas.

Nitrogen pentoxide, nitric anhydride N<sub>2</sub>O<sub>5</sub>, a white crystalline solid.

### **What is nitrogen monoxide?**

This is a colorless gas of sweetish taste and slight odor, sometimes termed nitrous oxide, also laughing gas, N<sub>2</sub>O, m. w. 44; one liter weighs 1.97 grams; sp. gr. 1.527; coercible with 30 atmospheres pressure at 0° C. It is a supporter of combustion, inflaming glowing embers immersed in it as in oxygen.

**How is N<sub>2</sub>O produced ?**

By the decomposition of ammonium nitrate by heat.

**What is its physiological effect, and for what purposes used ?**

It produces first exhilaration, then anaesthesia and asphyxia. It is used as an anesthetic for short operations, for which it is regarded as quite safe.

**What is nitrogen dioxide ?**

A colorless gas N<sub>2</sub>O<sub>2</sub>, m. w. 60 ; one liter weighs 1.34 grams ; sometimes called nitric oxide, sp. gr. 1.038, coercible, slightly soluble in water, forms with O or atmospheric air brown vapors of nitrogen tetroxide N<sub>2</sub>O<sub>4</sub>.

**How is N<sub>2</sub>O<sub>2</sub> prepared, and for what used ?**

By the reduction of nitric acid by metals, such as copper, Cu<sub>3</sub>+8HNO<sub>3</sub>=3Cu(NO<sub>3</sub>)<sub>2</sub>+4H<sub>2</sub>O+N<sub>2</sub>O<sub>2</sub> ; it may be employed to detect oxygen in gases.

**What is nitrogen trioxide ?**

A dark blue liquid boiling at 0° C., N<sub>2</sub>O<sub>3</sub>, m. w. 76 ; it forms with water nitrous acid, N<sub>2</sub>O<sub>3</sub>+H<sub>2</sub>O=2HNO<sub>2</sub>, which forms nitrites with bases.

**Describe nitrogen tetroxide and its use.**

A yellowish-brown liquid or brown vapor at ordinary temperature ; N<sub>2</sub>O<sub>4</sub> resulting when N<sub>2</sub>O<sub>2</sub> is exposed to the air. It is an oxidizing agent, used in converting H<sub>2</sub>SO<sub>3</sub> into H<sub>2</sub>SO<sub>4</sub>.

**State what results when nitrogen pentoxide unites with water, and give character of product.**

Nitrogen pentoxide forms with water nitric acid, N<sub>2</sub>O<sub>5</sub>+H<sub>2</sub>O=2HNO<sub>3</sub>, a colorless, fuming, corrosive acid liquid, m. w. 63, sp. gr. 1.52.

**How is nitric acid prepared ?**

By the action of sulphuric acid on a nitrate.

**What are the chemical properties of  $\text{HNO}_3$ ?**

It is a monobasic acid of great oxidizing power, coloring organic nitrogen compounds yellow, and converting others, such as glycerin, cotton, etc., into explosives of great force.

**What is fuming nitric acid? What the acidum nitricum U. S., and the acid. nitric. dil. U. S.?**

Fuming nitric acid is a nitric acid containing nitrogen dioxide in solution. Acid. nitric. U. S. a colorless nitric acid, sp. gr. 1.42, containing 69.4 per cent.  $\text{HNO}_3$ . Acid. nitric. dilut. has a sp. gr. 1.039, and contains 10 per cent.  $\text{HNO}_3$ .

**What is the effect of  $\text{HNO}_3$  as a poison?**

The same as the other corrosive mineral acids, with the only difference that the eschars are yellow.

**Give the tests for nitric acid and for nitrates.**

Nitric acid gives yellowish-red stains on dark textiles, not removable by ammonium hydrate; it colors blue litmus red, darkens ferrous sulphate in presence of sulphuric acid, bleaches indigo solution, gives rise to red vapors with copper slips, and gives a red color on addition of brucine. The nitrates are recognized by the same tests if the  $\text{HNO}_3$  is first liberated by  $\text{H}_2\text{SO}_4$ .

**What is nitro-hydrochloric acid?**

A mixture of 3 parts of  $\text{HNO}_3$  and 5 of  $\text{HCl}$ , also called aqua regia, as it dissolves gold and platinum, which neither alone effects. This is due to free chlorine and chlorine derivatives (nitroxyl chloride  $\text{NO}_2\text{Cl}$  and nitrosyl chloride  $\text{NOCl}$ ).

## **Phosphorus.**

**What is phosphorus?**

A waxlike, colorless, or slightly yellow, semi-transparent elementary solid, luminous in the dark. Symbol  $\text{P}^{\text{I}} \text{III}^{\text{V}}$ , a. w. 31, m. w. 124, vapor density 62, sp. gr. 1.83, melts at 44° C. to a colorless liquid, boils at 290° C. It occurs in two allotropic states.

**How is the molecular weight of bodies obtained?**

By multiplying their vapor density by two.

**What are some of the principal physical properties of phosphorus?**

It is soft and tough at ordinary temperature, insoluble in water, soluble in ether and alcohol, very soluble in carbon disulphide, from which it crystallizes in rhombic dodecahedra.

**Describe what two principal allotropic modifications of phosphorus there are, and what properties has the second.**

The one is yellow and the other is dark-red ; the latter is called amorphous ; the red is insoluble in carbon disulphide, is not luminous, is not poisonous, and does not melt.

**How is red phosphorus prepared from the yellow?**

By heating the yellow in an atmosphere of  $\text{CO}_2$  to  $300^{\circ}\text{ C}$ .

**State the chemical properties of phosphorus.**

It has a great affinity for O, combining with it at a comparatively low temperature, and for that reason has to be kept under water. It also combines with H and Cl, Br and I.

**Where and how does phosphorus occur?**

It is not found free in nature, but as phosphates. Its principal source is the calcium phosphate of bones.

**What is one of the technical uses for phosphorus?**

In the manufacture of friction matches, for which the red variety is preferable as less injurious to the operators. It is also used in rat poisons.

**What is the local action of phosphorus?**

When handled carelessly it ignites, causing severe burns and sloughs, not infrequently accompanied by systemic intoxication.

**What are the results of inhaling its fumes for some time, as in match factories?**

Chronic poisoning, resulting frequently in maxillary necrosis.

**State the symptoms of acute poisoning by phosphorus.**

It is an insidious poison, killing sometimes soon after ingestion, but frequently only for some time after with symptoms of acute, yellow atrophy of liver, jaundice, suppression of urine, delirium, uræmia, and coma.

**What is the treatment for and what is the antidote to poisoning by phosphorus?**

Stomach pump, cupric sulphate as emetic, which is antidotal as well, rendering the phosphorus non-assimilable as copper phosphide, also old spirits of turpentine.

**How can the lucifer disease in match factories be prevented?**

By good ventilation, and having oil of turpentine placed openly about the work-rooms, and worn in cloths or sponges around the necks of operators, but principally by the employment of the red variety only.

**What is a good test for phosphorus?**

By boiling the substance suspected to contain it in acidulated water, and allowing the vapors to strike a paper containing silver nitrate, which is colored dark by the formation of silver phosphide.

**Explain the principle of Mitscherlich's test for phosphorus.**

It is based upon the distillation of the substance suspected to contain phosphorus from acidulated water, when, upon striking the cool surface of the condenser, it will give rise to luminosity at that point if viewed in the dark. Alcohol, ether, oil of turpentine, and other essential oils interfere with this test.

**In examining vomited matter or a stomach suspected to contain phosphorus, what should be done?**

It should be inspected in the dark for luminosity, and also be examined for its characteristic odor.

**What is phosphine?**

A hydrogen compound of phosphorus, termed hydrogen phosphide  $\text{PH}_3$ , m. w. 34. It is a colorless gas, with a garlicky odor. It ignites at about  $100^\circ \text{ C}.$ , is poisonous, and is sometimes liberated in marshes, when it is known as the ignis fatuus or Will-o'-the-wisp.

**Give the oxygen compounds of phosphorus.**

Phosphorus trioxide  $\text{P}_2\text{O}_3$  and phosphorus pentoxide  $\text{P}_2\text{O}_5$ .

**Which are the direct acids of phosphorus?**

Hypophosphorous acid  $\text{H}_3\text{PO}_2$ , the oxide of which has not been isolated. Phosphorous acid derived from  $\text{P}_2\text{O}_3 + 3\text{H}_2\text{O} = 2\text{H}_3\text{PO}_3$ . Phosphorous pentoxide yields with water orthophosphoric acid  $\text{H}_3\text{PO}_4$ , as follows :  $\text{P}_2\text{O}_5 + 3\text{H}_2\text{O} = 2\text{H}_3\text{PO}_4$ .

**What are the other phosphoric acids, and how derived?**

By the abstraction of one molecule of water from respectively one or two molecules of  $\text{H}_3\text{PO}_4$ , the meta- and pyrophosphoric acids are formed as follows :—

**State the salts respectively formed by the different phosphoric acids.**

Hypophosphorous acid forms hypophosphites, phosphorous acid phosphites, orthophosphoric acid orthophosphates, metaphosphoric acid metaphosphates, and pyrophosphoric acid pyrophosphates.

**What salts are formed by the orthophosphoric or tribasic phosphoric acid?**

Three different kinds of salts, according to the number of H atoms displaced. Thus the mono-sodium or acid sodium phosphate  $\text{NaH}_2\text{PO}_4$  as found in the urine ; di-sodium or neutral sodium phosphate  $\text{Na}_2\text{HPO}_4$  as found in the blood ; also the hydro-calcium phosphate  $\text{Ca}(\text{H}_2\text{PO}_4)_2$ , and the normal calcium phosphate  $\text{Ca}_3(\text{PO}_4)_2$  of the bones. Besides these, double salts may be formed by a univalent and a divalent atom together displacing the three H as in ammonium-magnesium phosphate  $\text{NH}_4^+ \text{Mg}^{2+} \cdot \text{PO}_4^-$ .

**Which is the acidum phosphoricum of the U. S. Pharmacopœia, and what the test for it?**

The orthophosphoric acid  $\text{H}_3\text{PO}_4$ , recognized by giving a yellow precipitate with silver nitrate when neutralized with ammonium hydrate, and by giving a white precipitate with the magnesium mixture. These tests apply equally to its salts.

## Arsenic.

### **What is arsenic?**

A steel-gray crystalline, elementary solid, of metallic lustre. Symbol As<sup>III</sup> V, a. w. 75; sp. gr. 5.7, m. w. 300 (a second amorphous variety of black color, has a sp. gr. of 4.71); volatilizes at 180° C. without fusing, giving rise to yellowish-brown fumes of garlicky odor. It gradually oxidizes in the air, and burns at red heat with blue flame to form arsenious oxide.

### **How is arsenic found in nature?**

Sometimes in its free state, but generally as a compound of other elements, such as sulphur or oxygen (As<sub>2</sub>O<sub>3</sub>) and the metals Fe and Co. It is separated from its oxide by heating with charcoal As<sub>2</sub>O<sub>3</sub> + 3C = 2As + 3CO.

### **What is the technical use of arsenic?**

In fireworks, the manufacture of shot, and as fly-powder, under the name of cobalt or fly-stone.

### **Describe the hydrogen compound of arsenic.**

Hydrogen arsenide or arsine, also called arseniuretted hydrogen, a colorless gas of garlicky odor AsH<sub>3</sub>, m. w. 78, sp. gr. 2.7; it is very poisonous.

### **What are the chemical properties of AsH<sub>3</sub>?**

It burns in the air with a bluish flame, to arsenious oxide As<sub>2</sub>O<sub>3</sub>. If its combustion is interfered with by introducing into its flame a cold surface of porcelain, it deposits thereon a brownish-black stain of elementary arsenic. If heated to redness in a glass tube conducting it, it deposits a mirror-like ring of elementary arsenic beyond the flame. It decomposes solutions of silver nitrate into metallic silver, forming arsenious acid.

### **How is hydrogen arsenide formed and prepared?**

By the action of nascent hydrogen on arsenical compounds, also by the action of moist air and organic compounds on arsenical pigments. It is principally prepared by generating hydrogen in the presence of arsenious oxide as follows :—

**What compounds does arsenic form with oxygen?**

Arsenic trioxide or arsenious oxide  $\text{As}_2\text{O}_3$ , and arsenic pentoxide or arsenic oxide  $\text{As}_2\text{O}_5$ .

**In what forms does arsenic trioxide occur?**

It occurs in two varieties, the vitreous or amorphous as transparent glassy masses, sp. gr. 3.78, which gradually change to the non-transparent or porcelainous variety of crystalline structure, sp. gr. 3.69. The commercial variety comes in powder form and is called white arsenic.

**State the properties of  $\text{As}_2\text{O}_3$ .**

It volatilizes at 218° C., is white or colorless, odorless, is only slightly soluble in cold water, about 1 to 2 parts per 1000, more readily soluble in boiling water, and after boiling for one hour 60-80 parts dissolve in 1000. (Aqua Tofani.)

**What is the action of  $\text{HNO}_3$  on  $\text{As}_2\text{O}_3$ ?**

It gives up O to the  $\text{As}_2\text{O}_3$  and forms  $\text{As}_2\text{O}_5$ .

**What do the oxides of arsenic form with water?**

Arsenic trioxide forms with water arsenious acid,  $\text{As}_2\text{O}_3 + 3\text{H}_2\text{O} = 2\text{H}_3\text{AsO}_2$ . Arsenic pentoxide forms arsenic acid.  $\text{As}_2\text{O}_5 + 3\text{H}_2\text{O} = 2\text{H}_3\text{AsO}_4$ , both giving acid reactions.

**Name the respective salts of arsenious and arsenic acid.**

Arsenites and arseniates.

**Which are the principal compounds of arsenic with the halogens?**

Arsenic trichloride  $\text{AsCl}_3$ , a colorless oily liquid. Arsenic tribromide  $\text{AsBr}_3$ , a white crystalline substance. Arsenic triiodide  $\text{AsI}_3$ , red crystals.

**What are the sulphur compounds of arsenic?**

Arsenic trisulphide  $\text{As}_2\text{S}_3$  when  $\text{As}_2\text{O}_3$  is precipitated by  $\text{H}_2\text{S}$ ; it also occurs in nature as *auripigment* or *orpiment* or king's yellow, and is used as a yellow pigment, also as a depilatory. There is also an arsenic pentasulphide  $\text{As}_2\text{S}_5$ , and an arsenic disulphide  $\text{As}_2\text{S}_2$ ; the latter exists in nature, and under the name of *realgar* is used as a red pigment.

**Name the Pharmacopœial preparations of arsenic and their strength.**

*Liquor potassii arsenitis, Fowler's solution,  $1\text{As}_2\text{O}_3$ , and  $1\text{KHCO}_3$  in 100 water with compound spirit of lavender.*

*Liquor acidi arseniosi, solution of arsenic chloride, containing 1 part  $\text{As}_2\text{O}_3$  and 2 parts  $\text{HCl}$  in 100 water.*

*Liquor arsenici et hydrargyri iodidi, Donovan's solution, containing 1 part  $\text{AsI}_3$  and  $1\text{HgI}_2$  in 100 water.*

*Liquor sodii arseniatis, solution of sodium arsenite, Pearson's solution, 1 part anhydrous sodium arsenite in 100 water.*

**What is Scheele's green, and what Paris green?**

Compounds of arsenious acid and copper, frequently used with homicidal intent, and employed to destroy insects.

**Do wall papers contain arsenic, and in what quantity?**

Many contain arsenic in quantities from 1 to 50 grains to the square yard. This is not confined to low priced paper or those of green color alone.

**Is arsenic found in textiles, etc., and how may it prove injurious in this way?**

It is found in various textiles, prints, cretonnes, tarlatans, etc., and may give rise to poisonous symptoms by direct absorption as well as by inhalation of  $\text{AsH}_3$  produced from the reduction of the  $\text{As}_2\text{O}_3$  therein.

**In what manner does arsenic prove poisonous?**

Elementary arsenic is probably not poisonous as such, but by oxidation it becomes so. As fly-stone or fly-paste it becomes poisonous by oxidation to  $\text{As}_2\text{O}_3$ .

**How is  $\text{AsH}_3$  as a poison?**

It is the most poisonous of all As compounds, on account of its rapid absorption by the lungs.

**Which is the most common poisonous compound of As?**

$\text{As}_2\text{O}_3$ , contained in the ratbanes of the market; its smallest poisonous dose is two grains; but recovery has been known to take place after ingestion of two ounces: chances appear better for recovery after large doses than small ones, as they are more

promptly ejected. Fowler's solution taken in overdoses frequently proves a source of poisoning ; children appear less susceptible than adults.

#### **What is the toxic action of arsenic compounds ?**

They are irritants but not corrosives ; ulceration results from irritation and inflammation indirectly, therefore the stomach-pump may be used in the earlier stages but not later on. Inflammation may also be found in the intestines, peritoneum, and bladder, but principally in the duodenum, oesophagus, pharynx, and the mouth may also be inflamed from vomiting.

#### **What are the preserving powers of arsenical compounds ?**

Cadavers are preserved by them, and thus marked preservation of an exhumed body would direct suspicion to arsenical poisoning.

#### **Give the symptoms of arsenical poisoning.**

They come on in from a half hour to ten hours ; if early, chances for recovery are more favorable. Symptoms : austere metallic taste, fetid breath, constriction of pharynx and oesophagus, sinking sensation with great precordial pains, retching and vomiting, intense thirst, but drinks are not tolerated no matter how bland ; darting, shooting pains in colon, colitis, dark bloody stools, small thready pulse, cold skin, pinched nose, collapse, eruption of skin may break out in a few days, sensation benumbed, paralysis, tetanic spasms, delirium, prostration, and death.

#### **Are all cases alike ?**

Not always ; patient may die, as in cholera morbus or in Asiatic cholera, with suppression of urine and without gastric irritation, and the general symptoms may vary greatly.

#### **What are the symptoms of slow arsenical poisoning ?**

Nausea, occasional vomiting, colitis, fever, debility, conjunctivitis, oedematous eyelids, ptyalism, alopecia, and brown pigmentary spots on skin.

#### **What is the treatment for arsenical poisoning ?**

Evacuate the stomach by favoring emesis with warm water or warm milk or even zinc sulphate ; give demulcents such as eggs

and milk, and then give the chemical antidote, ferric hydrate in tablespoonfuls every 5-10 minutes, or in place of it dialyzed iron, which, however, is not so reliable.

**How is ferric hydrate prepared? What its other name, and what its action as an antidote?**

Ferric hydrate or hydrated oxide of iron can be prepared in different ways. It may be prepared by completely precipitating the solution of a ferric salt with ammonium hydrate and washing the resulting precipitate. A better preparation is the ferri oxidum hydratum cum magnesia, resulting by precipitating tinct. ferri chloridi  $\frac{5}{3}$ ij with magnesia calcinata  $\frac{5}{3}$ ij. The mixture of these diluted with water should be exhibited freely. In absence of magnesia a solution containing one ounce of sodium carbonate may be substituted for it. When magnesia is used the reaction is as follows :  $\text{Fe}_2\text{Cl}_6 + 3\text{MgO} + 3\text{H}_2\text{O} = \text{Fe}_2(\text{OH})_6 + 3\text{MgCl}_2$ . The action of the antidote on arsenic trioxide may be demonstrated as follows :  $2\text{Fe}_2(\text{OH})_6 + \text{As}_2\text{O}_3 = \text{Fe}_2\text{AsO}_4 + 5\text{H}_2\text{O} + \text{Fe}(\text{OH})_2$ , i.e., the arsenic trioxide will be converted into an inert ferrous arseniate.

**Describe the test for arsenic when found in substance.**

Place the particles found in a small reduction tube and heat, when it will be sublimed in the cooler portion of the tube as octahedral crystals. If the particles are covered with flux (a mixture of equal parts of dry sodium carbonate, and potassium cyanide), or with charcoal, the  $\text{As}_2\text{O}_3$  will be reduced, and an arsenical mirror will form in the cooler portion of the tube. To confirm the character of the mirror, heat the mirror with access of air, when it will sublime in the cooler portion of the tube as a white ring, which, under the microscope, will be found composed of the octahedral crystals of  $\text{As}_2\text{O}_3$ .

**What is necessary in testing for arsenic?**

The test has to be confirmed in as many ways as possible.

**How are solutions suspected to contain arsenic to be tested?**

Acidulate them with a few drops of HCl, and treat with  $\text{H}_2\text{S}$ . If arsenic is present, a lemon-yellow precipitate will be thrown down ; this is not soluble in cold HCl, and should be further

tested after filtration and drying by reducing it with flux, and producing the arsenical mirror and the white ring of octahedral crystals.

**What is Fleitmann's test for arsenic?**

This depends on the fact that zinc or aluminium produces H with KOH or NaOH ; the former at the boiling point, and the latter at ordinary temperature. If, after generating the H, the purity of the materials is tested by placing a piece of filtering paper moistened with  $\text{AgNO}_3$  over the test-tube containing them, and this is not discolored by it, a few drops of the suspected liquid are added, when, if arsenic is present, the paper containing the  $\text{AgNO}_3$  will present a dark stain ; the presence of  $\text{H}_2\text{S}$  or sulphides should, however, first be excluded by testing the liquids with a solution of a lead salt. This test, while convenient as a preliminary test, is not conclusive evidence. It does not give any reaction with antimonials.

**Describe some other tests for arsenic in solution.**

Ammonio-sulphate of copper will give a bright-green precipitate with arsenical solutions, and ammonio-nitrate of silver a yellow precipitate. Neither of these precipitates is conclusive, and should be reduced with flux to give the mirror and subsequent white ring of octahedral crystals.

**What is Reinsch's test for arsenic? Describe it.**

The test by which arsenical compounds are reduced with metallic copper. To that purpose the purity of the copper and HCl should first be tested by boiling the copper slip or gauze in diluted HCl. If, after boiling, the copper does not tarnish, add some of the suspected liquid and boil again. If arsenic is present, the copper will be coated with elementary arsenic. This can be demonstrated by drying and rolling up the copper slip, and heating it in an open glass tube. If it is As, there will appear in the cooler portion of the tube the characteristic white ring of octahedral crystals of  $\text{As}_2\text{O}_3$ .

**What other substances may deposit on the copper in this test?**

Sb and Hg may also deposit on the copper in Reinsch's test,

but they will give respectively amorphous or metallic globular sublimates.

#### **How can Reinsch's test be made quantitatively?**

By gradually inserting into the boiling acid mixture previously weighed pieces of copper until they are no longer coated ; they are then dried and weighed ; the increase in weight giving the amount of As in the quantity of liquid employed.

#### **What are the advantages and disadvantages of Reinsch's test ?**

The advantages are that it can be made in the presence of organic matter ; that it is very delicate, and can be made quantitative as well. Its disadvantages are that it is not available for arsenic acid or arseniates without previous reduction.

#### **Describe Marsh's test for arsenic.**

This depends upon generating H from pure zinc with pure  $H_2SO_4$  from a suitable apparatus ; the purity of the materials and apparatus being tested by allowing the hydrogen to burn for some time, and testing with a cool porcelain surface inserted into the flame. If no stain is thus produced, introduce some of the suspected liquid through the funnel tube, and again test the flame with the porcelain ; if a stain results, arsenic may be present, the flame in this case will be blue, and if the conducting tube is heated to redness in its course, a mirror will form in the tube beyond the flame.

#### **What are the advantages and disadvantages of Marsh's test ?**

Its advantages are that arsenious acid, arsenites, arsenic acid, and arseniates can be detected by it ; its disadvantages that it cannot be employed in the presence of organic material, which must first be destroyed by  $KClO_3$  and  $HCl$ , and that it shows antimony as well as arsenic.

#### **How can the stains of As and Sb on the porcelain produced by Marsh's test be differentiated ?**

Arsenic stain is instantly soluble in  $NaClO$ , antimony is not ; As stain dissolves slowly only in  $NH_4HS$ , Sb instantly ; As stain dissolved in  $HNO_3$  and evaporated gives a brick-red stain with  $AgNO_3$ , Sb does not. The mirror in the tube, if As, is beyond the

flame ; if Sb, nearer and on either side of the flame, and may be differentiated as above.

**What is the comparative sensitiveness of Reinsch's and Marsh's test?**

Reinsch's shows  $\frac{1}{10000}$  grain ; Marsh's  $\frac{1}{50000}$  grain.

**How is As determined quantitatively by Marsh's test ?**

By letting the  $\text{AsH}_3$  pass through an excess of  $\text{AgNO}_3$  solution until no further precipitation takes place. After this the excess of  $\text{AgNO}_3$  is precipitated by  $\text{NaCl}$ , the liquid filtered, and the filtrate precipitated by  $\text{H}_2\text{S}$ , the resulting  $\text{As}_2\text{S}_3$  is then dried and weighed, 5 parts of the sulphide corresponding to 4  $\text{As}_2\text{O}_3$ .

### Antimony.

**What is antimony ?**

An elementary, crystalline, bluish-white solid, of metallic lustre,  $\text{Sb}^{\text{III}}$  v, a. w. 120, sp. gr. 6.7, fuses at 430° C.

**What are its chemical properties ?**

It exhibits the metallic character more so than arsenic, combines directly with the halogens, and is oxidized by  $\text{HNO}_3$ . It volatilizes at a bright-red heat, burning in the air to antimony tri-oxide  $\text{Sb}_2\text{O}_3$ .

**How does it occur in nature, and what is its use in the arts ?**

It is found in nature as black sulphide, termed crude antimony or black antimony, and is used in the arts as an alloy, principally in type-metal.

**What is the hydrogen compound of Sb ?**

Hydrogen antimonide or stibine  $\text{SbH}_3$ , a colorless gas which burns with a greenish flame when ignited. It is not so poisonous as  $\text{AsH}_3$ , and when conducted through a solution of  $\text{AgNO}_3$  it forms a black precipitate, but not of silver, as in the case of  $\text{AsH}_3$ , but of silver antimonide.

Like  $\text{AsH}_3$  when a piece of cold porcelain is introduced into its flame, it gives a dark stain, and when heated to redness it deposits elementary Sb.

**What compounds of Sb are used in medicine ?**

*Antimony trichloride, butter of antimony, SbCl<sub>3</sub>, in the liquor antimonii chloridi used as an escharotic ; antimony trioxide Sb<sub>2</sub>O<sub>3</sub> in pulvis antimonialis ; antimony sulphide Sb<sub>2</sub>S<sub>3</sub> ; antimonium sulphuratum, a mixture of Sb<sub>2</sub>S<sub>3</sub> with Sb<sub>2</sub>O<sub>3</sub> in Plummer's pill, and a compound of similar composition, termed antimonii oxysulphuretum or Kermes mineral ; also the *antimonii et potassii tartras*, tartar emetic, in vinum antimonii, unguentum antimonii tartratis, syrupus scillæ compositus.*

**What is tartar emetic and its properties ?**

It is the most common of the antimonial compounds used in medicine ; KSbO.T a crystalline white substance, of metallic taste, freely soluble in water with acid reaction, and chars when heated to redness.

**What are the symptoms of poisoning by tartar emetic ?**

Metallic taste, nausea, vomiting, purging, pain in epigastrium, intense thirst, as with As, cardiac depression, cramps, convulsions, collapse ; fatal dose from gr. ii to 3ss may produce death in from 7 hours to 4 weeks.

**What is the treatment for poisoning by antimony ?**

Favor emesis or induce it by diluent drinks, strong tea, tannin, ferric hydrate if doubt as to As. After the more stormy symptoms have subsided the great danger is cardiac depression, which must be met with stimulants.

**How does tartar emetic act if continued for some time ?**

It gives rise to perverted health and gradual exhaustion.

**How is Sb detected in suspected chronic poisoning ?**

Obtain vomit or urine for several days ; concentrate this and acidulate with HCl. Put some on a bright platinum dish and touch for a little while with a slip of zinc, when a black stain of antimony will form on the platinum, soluble in ammonium sulphhydrate, and leaving, on evaporation, an orange-yellow stain.

**How can Sb be also detected in concentrated urine or other liquids ?**

By Reinsch's or Marsh's test, also by dipping pure tinfoil in

the acidulated solution when it will be coated with Sb if present. In all cases antimony itself must be produced and verified with ammonium sulphhydrate.

### How can Sb be detected by H<sub>2</sub>S?

H<sub>2</sub>S conducted through an acidulated solution of Sb will throw down a reddish-yellow amorphous precipitate of Sb<sub>2</sub>S<sub>3</sub>, soluble in NH<sub>4</sub>HS, insoluble in NH<sub>4</sub>HO. This has to be reduced by flux and made to appear as Sb mirror.

### How can Sb be determined quantitatively?

By weighing the Sb<sub>2</sub>S<sub>3</sub>; 100 parts equal 196.4 KSBOT. The Sb<sub>2</sub>S<sub>3</sub> may also be dissolved in HCl and then recovered as Sb with Reinsch's test, the increased weight of the copper slips giving the amount of Sb present.

## Boron Group.

### What elementary substance constitutes this group, and why?

Boron, B<sup>(II)</sup>, a. w. 11, sp. gr. 2.68, a greenish-brown solid body, amorphous or crystalline; on account of its chemical properties it cannot be classed with other elements.

### What is the principal boron compound of medical interest?

Boric acid H<sub>3</sub>BO<sub>3</sub>, occurring free in nature; it comes in white crystalline scales, soluble in 25 parts of water, and is also insoluble in alcohol. It reddens litmus paper, turns turmeric brown, and its alcoholic solution burns with a green flame; it is a valuable antiseptic.

### What chemical change does boric acid undergo on heating?

At 100° C. it loses one molecule H<sub>2</sub>O, (H<sub>3</sub>BO<sub>3</sub>—H<sub>2</sub>O=HBO<sub>2</sub>) forming meta-boric acid HBO<sub>2</sub>; heated to 140° C. it forms tetraboric acid H<sub>2</sub>B<sub>4</sub>O<sub>7</sub>.

### What is the principal salt of H<sub>2</sub>B<sub>4</sub>O<sub>7</sub>?

Its sodium salt termed borax Na<sub>2</sub>B<sub>4</sub>O<sub>7</sub>, which occurs in nature and finds large application in medicine and the arts.

## Electronegative Tetrad or Carbon Group.

**What elements constitute this group?**

Carbon and silicon.

### Carbon.

**What is carbon?**

An elementary solid, C<sup>II & IV</sup>, a. w. 12, occurring in three principal allotropic modifications ; it is not fusible nor volatile.

**What are the principal forms carbon is found in?**

*Diamond*, a crystalline substance of the monometric system, of great lustre and hardness, sp. gr. 3.5, good conductor of heat and electricity, combustible at intense heat to CO<sub>2</sub>.

*Graphite*, a leaden gray, usually amorphous, substance of unctuous touch, sp. gr. 2.25, good conductor of heat and electricity ; occasionally found crystalline in hexagonal plates, combustible with difficulty ; it is sometimes termed plumbago, and used for making lead pencils.

*Amorphous carbon*, the product of incomplete combustion of organic bodies ; also found in the fossil state.

**Name the different varieties of amorphous carbon.**

Soot or lampblack, vegetable coal or charcoal, animal coal or boneblack, gas carbon or plumbagine, bituminous or soft coal, also cannel coal, coke, and anthracite or hard mineral coal.

**Describe lampblack and its use.**

The carbonaceous matter condensed from the incomplete combustion of resins and hydrocarbons, etc., a finely divided form of carbon used for making printing and marking inks.

**Describe charcoal and its use.**

The product of incomplete combustion of wood, has a black color, is odorless, tasteless, sp. gr. 1.7 ; it is very porous, and can absorb many gases and vapors (90 volumes NH<sub>3</sub>, 55 H<sub>2</sub>S, 9 O<sub>2</sub>) ; it is a powerful disinfectant. When saturated with one kind of gas it can still take up others ; it contains condensed oxygen which can oxidize decaying matter and decolorize organic colors.

**Describe animal charcoal, its manner of purification and use.**

A similar production from bone as charcoal from wood ; it is purified by treating it with HCl, and used as an antidote for alkaloidal poisons, which it absorbs.

**Describe gas carbon and its use.**

The carbon deposited in gas retorts, very hard, of metallic lustre, good conductor of electricity, therefore used in galvanic batteries.

**Describe the principal varieties of mineral coal.**

Fossil coal in its different varieties containing C, N, H, O, and S, besides mineral ash. Bituminous coal is rich in hydrocarbons, and when incompletely combusted leaves coke. Anthracite is the purest variety of mineral coal, is a good conductor of heat, and contains about 96-98 per cent. of pure C.

**What are the compounds of carbon with hydrogen, and under what head are they generally considered ?**

Hydrocarbons, which, together with their derivatives, are generally considered under the head of organic chemistry. (See Hydrocarbons and their derivatives.)

**Which are the oxygen compounds of carbon ?**

Carbon dioxide CO<sub>2</sub>, carbon monoxide CO.

**What is carbon dioxide, and what else is it called ?**

Carbon dioxide, CO<sub>2</sub>, also termed carbonic anhydride or carbonic acid gas, is a colorless gas of slightly pungent odor and acid taste.

**State the physical properties of CO<sub>2</sub>.**

It is heavier than air, sp. gr. 1.524, and can therefore be poured from one vessel to another ; it will dissolve in equal volumes of water without pressure and much more with pressure. It condenses under a pressure of 36 atmospheres at 0° C. to a colorless mobile liquid, which, when allowed to evaporate, leaves portions of the CO<sub>2</sub> as a snow-like solid.

**What are the chemical properties of CO<sub>2</sub> ?**

It is neither combustible nor a supporter of combustion, unites

with water to form carbonic acid,  $\text{CO}_2 + \text{H}_2\text{O} = \text{H}_2\text{CO}_3$ , which forms carbonates with the bases, is dibasic, and produces both acid and normal salts.

### How is $\text{CO}_2$ prepared?

By the decomposition of carbonates by acids. In the gazogenes by tartaric acid and sodium bicarbonate, similarly in the effervescent powders of the Pharmacopœia, but for laboratory use or the manufacture of carbonic acid waters by the decomposition of marble (calcium carbonates), with hydrochloric or sulphuric acid.

### Is $\text{CO}_2$ found in nature and where? How does it result?

It is found in nature as resulting from the direct combustion of carbon, also the decomposition of  $\text{CaCO}_3$  by heat to form lime ( $\text{CaCO}_3 = \text{CaO} + \text{CO}_2$ ), as resulting from terrestrial exhalations in caves and mines, when it is called choke-damp; it also results from fermentation in cellars and brewery vats; it is found free in the atmosphere in the proportion of about 0.05 per cent. volume.

### Where else does $\text{CO}_2$ result from, in what amounts, and how can its presence be proven?

$\text{CO}_2$  also results as a consequence of the oxidation of the food and tissues in the body, and is exhaled as waste product by the lungs, the respired air containing about 4 per cent. volume. Its presence can be proven by breathing into lime water (calcium hydrate  $\text{Ca}(\text{OH})_2$ ), which will be rendered turbid by the insoluble  $\text{CaCO}_3$  formed; this will be redissolved by an excess of  $\text{H}_2\text{CO}_3$ .

### How is $\text{CO}_2$ principally used in medicine and dietetics?

As carbonic acid waters or sparkling wines impregnated with  $\text{CO}_2$  under pressure; it imparts to them a refreshing, biting, sparkling taste, and acts as sedative to the gastric mucous membranes; also in malt liquors where it results from fermentation.

**What is the effect of pure carbon dioxide when inhaled?**

It produces spasm of the glottis.

**When diluted with atmospheric air how does it act, and what amount of dilution will produce this effect?**

It will asphyxiate persons even when as little as 5 to 8 per cent. is contained in the atmosphere.

**How is CO<sub>2</sub> detected in caves, wells, vats, etc.?**

By lowering a lighted candle into them, which, if over 10 to 12 per cent. CO<sub>2</sub> is present, will be extinguished. If it burns dimly even, it is unsafe to descend into them, as the candle will burn where man cannot live.

**What is the amount of CO<sub>2</sub> in the atmosphere, and why does it not increase?**

The amount of CO<sub>2</sub> in the atmosphere is about 4 parts by volume in 10,000. This is quite constant, as the CO<sub>2</sub> generated in the various ways is absorbed by plants and also inorganic material.

**To what is the vitiation of the atmosphere in crowded rooms due?**

Partly to the carbonic dioxide exhaled by the persons in them and that generated by the burning of lights therein, also to the organic exhalations from the lungs.

**What is the smallest amount of space permissible for each occupant of dormitories?**

The space for each individual should not be less than 400 cubic feet, but for the sick, and especially those suffering from offensive diseases, it should be at least two or three times as much.

**How does CO<sub>2</sub> act as a poison?**

It acts similar to water in drowning persons by keeping the oxygen of the air from reaching the haemoglobin of the blood, and preventing the elimination of the CO<sub>2</sub> produced in the blood and tissues.

**How are persons overcome by CO<sub>2</sub> to be treated when in inaccessible localities?**

If they cannot be reached or removed from the place, by add-

ing freshly burned charcoal, which absorbs 35.5 volumes of the CO<sub>2</sub>, and by so doing sets up a current of air towards him, also by freshly slaked lime or forcing in currents of fresh air; if removed therefrom, by artificial respiration, cold douche, faradism, friction, etc.

### **What is carbon monoxide?**

Carbon monoxide or carbonous oxide, also improperly termed carbonic oxide, is a compound of divalent carbon with oxygen, CO<sup>II</sup>, m. w. 28. A colorless, odorless, tasteless gas, little soluble in water, sp. gr. 0.969.

### **How is it prepared, and how does it ordinarily result?**

It is prepared either by passing CO<sub>2</sub> over heated charcoal CO<sub>2</sub> + C = 2CO, or by heating oxalic acid with strong sulphuric acid, the latter decomposing and withdrawing H<sub>2</sub>O, and liberating CO<sub>2</sub> and CO; H<sub>2</sub>C<sub>2</sub>O<sub>4</sub> = H<sub>2</sub>O + CO<sub>2</sub> + CO. It results ordinarily by incomplete combustion of coal, as noticeable in coal stoves after the draft has been shut off, also in burning charcoal in the charcoal basins without fanning.

### **What are the chemical properties of Co?**

It does not support combustion, but is combustible, burning with a blue flame to CO<sub>2</sub>, reduces many metallic oxides at red heat, and as an unsaturated compound unites with other elements directly.

### **How does it act as a poison?**

It acts as a direct poison, paralyzing the red corpuscles, and destroying the function of haemoglobin as an oxygen carrier, by uniting with it to form carbonic-oxide haemoglobin, which cannot again form oxyhaemoglobin.

### **What is its effect when inhaled in small quantities?**

It produces languor, debility, anaemia, and its accompanying symptoms; as little as 0.5 per cent. will kill a bird.

### **Why is coal gas poisonous, and why is water gas more so than the former?**

Because coal gas contains about 5 per cent. CO, and water gas about 27 to 30 per cent.

**How can CO be determined quantitatively?**

By agitating the gas or air to be examined in a eudiometer with an ammoniacal solution of cuprous chloride, which will absorb it and indicate the amount by the difference of volumes after opening it under water.

**How is carbon monoxide detected in the blood after death?**

The blood has a bright-red color; when examined with the spectroscope it presents bands similar to oxyhaemoglobin; the latter, however, can be converted to reduced haemoglobin by reducing agents, but the carbonic oxide haemoglobin remains unaltered when thus treated.

**How are cases of poisoning by CO to be treated?**

Removing the gas present in the lungs by artificial respiration; this is not curative however. Transfusion of blood would be indicated here, also inhalation of oxygen, but principally liberal and readily assimilated foods, stimulants, and iron.

**What are the compounds of carbon with sulphur?**

Carbon disulphide  $\text{CS}_2$  and carbon oxysulphide  $\text{COS}$ .

**What is carbon disulphide?**

A colorless, mobile liquid, of high refractive power, peculiar disagreeable odor,  $\text{CS}_2$ , m. w. 76, sp. gr. 1.27, boiling at 46° C.; it burns with blue flame to  $\text{CO}_2$  and  $\text{SO}_2$ , dissolves iodine with violet color; also dissolves phosphorus, sulphur, caoutchouc, fats, and oils.

**What compound does carbon form with nitrogen?**

Cyanogen gas,  $\text{C}_2\text{N}_2$ , m. w. 52; a colorless gas, of penetrating, pungent odor, similar to that of peach kernels; sp. gr. 1.806; coercible, soluble in water, burning with purple-red flame to  $\text{CO}$  and  $\text{N}_2$ .

**What is  $\text{C}_2\text{N}_2$  really, and in which form found in compounds?**

$\text{C}_2\text{N}_2$  is really dicyanogen of the graphical formula  $\begin{array}{c} \text{C} \equiv \text{N} \\ | \\ \text{C} \equiv \text{N} \end{array}$  and is met with in compounds as the univalent radical cyanogen  $\text{Cy}$  or  $-\text{C}_2\text{N}_2-$ , which behaves chemically like the halogens, forming

ing binary compounds with the metals, such as KCy, AgC<sub>y</sub>, and forms a binary acid with H, *i. e.*, HCy, also ternary acids, such as cyanic acid HCNO, and sulphocyanic acid HCNS.

### What is hydrocyanic acid?

Hydrogen cyanide, also termed Prussic acid, HCN or HCy, a colorless, mobile liquid ; boiling at 27° C. ; of the specific odor of peach kernels.

### How is HCy formed, and how made?

It forms by the action of the emulsion of bitter almonds on the amygdalin contained therein, in a similar manner also in cherry laurel leaves, peach kernels, wild cherry bark, etc. It is also found in the essential oil of bitter almonds. It can be made by decomposing a cyanide KCy or AgC<sub>y</sub> with a stronger acid,  $2\text{KCy} + \text{H}_2\text{SO}_4 = \text{K}_2\text{SO}_4 + 2\text{HCy}$ .

### State the strength of U. S. and of Scheele's HCy.

The hydrocyanic acid of the U. S. Ph. contains 2 per cent. of HCy, Scheele's acid 5 per cent. The Pharmacopeial preparation is unstable, and therefore of uncertain strength.

### What is the toxic effect of HCy?

Hydrocyanic acid in solution, in vapor form, or as soluble cyanide, is very poisonous, death taking place, as a rule, within a short time, preceded by convulsions, unconsciousness, slow and labored respiration, cold extremities, dilated pupils ; generally the patient is dead before aid is rendered ; but if he survives one hour there is hope of recovery on account of the volatility of the poison.

### What is the treatment of poisoning by HCy?

Cold affusions, ammonia, galvanism, stimulants, atropine, chlorine developed from bleaching powder and vinegar. Smith's antidote, composed of ferrous and ferric salts, in presence of alkaline carbonates forms non-poisonous Prussian blue.

### How is HCy detected after death?

1. By the probable presence of its characteristic odor. 2. By placing the part to be examined, after acidulation, in a jar, and this in warm water, and then cover the jar with a glass plate

moistened with  $\text{AgNO}_3$ ; if  $\text{HgCy}$  is present a white film of  $\text{AgCy}$  will form; this is not soluble in cold  $\text{HNO}_3$  or only sparingly in  $\text{NH}_4\text{HO}$ . 3. Proceed in the former manner, but moisten the glass plate with  $\text{KOH}$ , instead of  $\text{AgNO}_3$ , and touch with a ferric and ferrous salt, which, on addition of  $\text{HCl}$ , gives rise to a deep blue color. 4. Moisten the glass plate as in the foregoing tests, but with ammonium sulphhydrate, and then test with solution of ferric chloride, which, if  $\text{HgCy}$  is present, gives rise to a red color, readily discharged on addition of a solution of mercuric chloride. This is due to ammonium sulphocyanide being formed, and saliva containing it gives the same reaction. Meconic acid also gives rise to a red color with ferric chloride, but it is not discharged on addition of  $\text{HgCl}_2$ .

**What is the oxyacid of  $(\text{CN})_2$ , and what compound does it form with ammonium?**

Cyanic acid  $\text{HCNO}$ , which forms ammonium cyanate  $\text{NH}_4\text{CNO}$  with ammonium.

**Of what interest is ammonium cyanate?**

Because it is isomeric with and convertible into carbamide or urea  $\text{CON}_2\text{H}_4$ .

**What is isomerism?**

When two substances are composed of the same kind and number of atoms, but of different physical characters, owing to the different arrangement of their atoms in the molecule.

**State and explain the two kinds of isomerisms.**

Metamerism, when bodies of different physical character correspond in centesimal composition and molecular weight, and polymerism when they correspond in centesimal composition, but their molecular weights are different, the one being the multiple of the other.

**Give the formula of sulphocyanic acid, name its salts, and which occur in the body.**

Sulphocyanic acid  $\text{HICNS}$ ; forms sulphocyanides; potassium and sodium sulphocyanide are found in the saliva, and give red color with ferric chloride, which is discharged by mercuric chloride.

**Which are the principal metallocyanides and their use?**

Potassium ferrocyanide,  $K_4FeCy_6$ , yellow prussiate of potassium, which gives blue precipitate of Prussian blue with ferric salts and potassium ferricyanide,  $K_6Fe_2Cy_{12}$ , red prussiate of potassium, which, with ferrous salts, gives a dark blue precipitate of Turnbull's blue.

**Silicon.****What is silicon?**

An elementary solid,  $Si^{IV}$ , a. w. 28.

**Which compound of silicon is most abundant?**

Silicie oxide  $SiO_2$ , m. w. 60, is found abundantly in minerals, quartz, rocks, and sand; it is found in all natural waters and in the cereals. Combined with water it forms acids which yield silicates.

**What silicates are of interest in medicine?**

The sodium or potassium silicates  $Na_2SiO_3$ ,  $K_2SiO_3$ , which are soluble in water, and are used for fixing surgical dressings under the name of liquid glass.

**What other silicates find common use?**

The mixed silicates of sodium and calcium, or potassium and calcium, or lead and potassium, under the name of glass.

**What are the different varieties of glass, their composition, and use?**

*Soda or soft* glass, composed of sodium and calcium silicates, fuses readily, used for window and ordinary glass vessels. *Potash, Bohemian*, also hard glass, composed of potassium and calcium silicates, not very fusible, are used for the manufacture of chemical glassware. *Crystal or flint* glass, composed of lead and potassium silicates, fuses more readily, refracts light, and acquires a clear lustre; it is used for lenses and optical purposes, etc.

## Metals of the Alkalies.

**Which are the metals belonging to this group and their common characteristics?**

Potassium, sodium, lithium, rubidium, caesium, and ammonium. This latter though a compound is generally grouped with them. They are all soft, fusible, and volatile, have great affinity for oxygen, decompose water, readily forming basic oxides which with water yield caustic hydrates; they form soluble carbonates and only one chloride.

### Potassium.

**What is potassium?**

A waxy, bluish-white metallic element K<sup>I</sup>, a. w. 39, sp. gr. 0.865, melting at 62.5° C., distilling at red heat.

**What are its chemical properties?**

It has a great affinity for O, tarnishes in the air, and if thrown on water it decomposes it;  $K + H_2O = KOH + H$  liberating H which ignites and burns with a violet flame. It has to be kept immersed in a hydrocarbon on this account.

**Where and how is K formed?**

Potassium exists in nature only in compounds, both in minerals as well as in plants, from the latter of which it is largely obtained by leaching out their ashes after combustion; it is then termed potash or pearlash, which consists principally of K<sub>2</sub>CO<sub>3</sub>.

**How is K separated from K<sub>2</sub>CO<sub>3</sub>?**

By reduction of the carbonate with charcoal and distilled over  $K_2CO_3 + 2C = 2K + 3CO$ .

**When metallic potassium is thrown on water how is the water affected after the reaction, and why?**

The water will become alkaline after reaction on account of the formation of potassium hydrate KOH.

**What is potassium hydrate?**

Potassium hydrate or hydroxide, also termed caustic potash KOH, m. w. 56.7, is a white crystalline mass which deliquesces readily, absorbing H<sub>2</sub>O and CO<sub>2</sub>; it has a strong alkaline reaction. is readily soluble in alcohol and water, and, from being cast in moulds, comes usually to market in thin sticks.

**How is KOH prepared?**

By decomposing the carbonate with calcium hydrate and evaporating the clear solution to dryness. K<sub>2</sub>CO<sub>3</sub>+Ca(OH)<sub>2</sub>=CaCO<sub>3</sub>+2KOH.

**What is the officinal solution of KOH?**

An aqueous solution of potassium hydrate termed liquor potassae containing about 5 per cent. KOH, sp. gr. 1.036; 28 grams should require not less than 25 c.c. of the volumetric solution of oxalic acid for neutralization.

**How is the strength of alkaline solutions determined?**

By alkalimetry with a volumetric solution of oxalic acid, *q. v.*

**How is the process of alkalimetry performed?**

A certain amount of the alkaline solution to be tested, say 10 c.c., is placed in a beaker glass diluted, and to it are added a few drops of blue litmus solution as an indicator; then the volumetric solution of oxalic acid is dropped into it until the change of color of the litmus to violet denotes the neutralization. The result is then computed either by stoichiometric proportion or by reference to already computed tables, or expressed simply in the quantity of oxalic acid solution used.

**What is the action of KOH on the tissues?**

It dissolves and destroys them.

**What class of poisons does it belong to, and what others belong to this class?**

The alkaline caustics, made up of potassium hydrate, sodium hydrate, and ammonium hydrate.

**State the symptoms produced by this class of poisons.**

Acrid taste, burning sensation in mouth and oesophagus, con-

striction of fauces, inability to swallow, intense pain in stomach, abdominal tenderness, purging, prostration, mouth and tongue covered with white blisters and eschars. If the patient survives there may be sloughing followed by stricture of the oesophagus and a white waxy appearance from inanition.

### **What are the antidotes for poisoning by the alkaline caustics?**

Diluted vinegar, lemon juice, or other mild vegetable acids, also oils, fats, or milk.

### **What are the tests for potassium hydrate?**

Alkaline reaction, absence of effervescence when neutralized with acids, violet color of non-luminous flame when platinum covered with it is introduced. Neutralized with HCl, a yellow precipitate with platinum chloride ensues.

### **Which are the potassium compounds with the halogens?**

Potassium chloride KCl crystallizes in vitreous cubes, sp. gr. 1.84, found in the blood. Potassium bromide KBr obtained together with potassium bromate, KBrO<sub>3</sub>, by the action of bromine on potassium hydrate, crystallizes in cubes, sp. gr. 2.24. Potassium iodide, KI, crystallizes in cubes, sp. gr. 2.9, dissolves in 0.7 parts of water. Potassium fluoride KFl crystallizes in cubes, is very soluble in water, and etches glass.

### **How are KBr and KI chemically distinguished?**

Their solutions when decomposed by Cl, give in the case of KBr, Br, recognized by giving a yellow compound with starch water, and in the case of KI, a blue starch iodide; the iodine liberated in this latter test can also be shown by the violet color imparted when shaken with CS<sub>2</sub> or with chloroform.

### **What is potassium cyanide?**

A compound of K with Cy, KCy, a white fusible mass, deliquescent in air, of the odor of prussic acid, is very poisonous like HCy only slower; treatment for poisoning by it is as in HCy.

### **Which is the officinal potassium sulphide?**

The liver of sulphur or potassium pentasulphide K<sub>2</sub>S<sub>5</sub>.

**What is potassium hypochlorite ?**

A compound of K with  $\text{HClO}$ , which exists only in solution, known as Eau de Javelle, which has a chlorine odor, and is a powerful bleaching and disinfecting agent.

**What is potassium chlorate ?**

A salt of chloric acid  $\text{HClO}_3$ , in which the H is replaced by K, formula  $\text{KClO}_3$ ; crystallizes in shining tablets, not readily soluble in water. It has a saline, cooling taste, is astringent, and is used to make oxygen, *q. v.*; it is used internally, and also as a gargle, etc; is poisonous in over doses, and after death is found in the kidneys; it explodes violently when heated or rubbed up with oxidizable substances, and should not be prescribed with these in powder form.

**Which are the two sulphates of potassium ?**

Neutral potassium sulphate  $\text{K}_2\text{SO}_4$ , crystallizes in rhombic prisms, of a bitter, saline taste, formerly employed in making Dover's powder. Acid potassium sulphate  $\text{KHSO}_4$ , crystallizes in rhombic tablets, readily soluble in water.

**Describe the salt known as saltpetre, and its use.**

Potassium nitrate  $\text{KNO}_3$ , also termed nitre; the result of the decay of nitrogenous substances in presence of potassium carbonate, this process being artificially employed for its production. It crystallizes in six-sided rhombic prisms, has a cooling taste, fuses at  $3.38^\circ \text{C}.$ , and at higher heat gives off oxygen. It is principally used in the manufacture of gunpowder; it is poisonous in over doses. Antidote: emetics and raw eggs.

**What two chromates of potassium are there ?**

Potassium chromate, also termed neutral potassium chromate,  $\text{K}_2\text{CrO}_4$ , yellow rhombic crystals, used as an indicator in the determination of chlorides. Potassium dichromate  $\text{K}_2\text{Cr}_2\text{O}_7$ , also called acid or red potassium chromate, crystallizes in large red triclinic prisms. It is used with  $\text{H}_2\text{SO}_4$  in battery fluid. It is an active poison. Antidote: magnesia and alkaline earths.

**What is potassium permanganate ?**

$\text{KMnO}_4$ , crystallizing in dark-purple prisms, soluble in water

with a beautiful purple color; a valuable oxidizing agent and disinfectant, oxidizing organic matter and forming brown manganese sesquioxide. Its solution in water is known as Condy's fluid.

### **Which are the two carbonates of potassium?**

The neutral potassium carbonate, salt of tartar, or pearlash  $K_2CO_3$ , a white granular deliquescent powder, readily soluble in water with alkaline reaction, and the hydropotassium carbonate or acid potassium carbonate, also termed potassium bicarbonate  $KHCO_3$ , crystallizing in monoclinic prisms, not so readily soluble in water as the normal salt.

### **What is potassium citrate?**

The potassium salt of citric acid, abbreviated formula,  $K_3C_6O_7$ ; officinal in the liquor potassii citratis, also the mistura potassii citratis; it is antifebrile, and renders the urine alkaline by being converted into carbonates.

### **Potassium acetate, what is it?**

A potassium salt of acetic acid  $KC_2H_3O_2$  or KA; crystalline and very deliquescent; it is diuretic and laxative.

### **Which is the principal potassium oxalate?**

The acid potassium oxalate or binoxalate of potassium  $KHC_2O_4$ ; a mixture of this with the quadroxalate is known as salt of sorrel or salt of lemon, used for removing ink stains; resembles Epsom salts in appearance, and often mistaken for it. It is poisonous, the same as oxalic acid, *q. v.*

### **What is potassium tartrate, and what acid potassium tartrate?**

Potassium tartrate or soluble tartar results when two H of tartaric acid are replaced by K;  $K_2C_4H_4O_6$ ; it is very soluble in water. Acid potassium tartrate or potassium bitartrate, also termed cream of tartar, the salt resulting when only one H of tartaric is replaced by K; it crystallizes in rhombic prisms, only slightly soluble in water, and of acid reaction.

### **From what is cream of tartar made?**

From argols, the impure acid potassium tartrate deposited from the grapes in the casks during vinous fermentation.

**How are potassium compounds recognized ?**

They are mostly readily soluble in water. Tartaric acid will give with concentrated solutions a white precipitate of acid potassium tartrate ; introduced into a non-luminous flame, they give rise to a violet coloration. The spectrum exhibits one red and one violet line.

**Sodium.****What is sodium ?**

A silver-white, soft, elementary metal  $\text{Na}^I$ , a. w. 5 $^{\frac{1}{2}}$ , sp. gr. 0.98 ; fusing at 97° C., and distilling over at red heat. It oxidizes and tarnishes readily when exposed, decomposes water disengaging H, and has to be preserved under a hydrocarbon. It burns with a yellow flame.

**How is sodium prepared ?**

Like potassium, by heating sodium carbonate and charcoal to a white heat in an iron retort, when it distils over.

**Where and how does sodium occur ?**

It is abundant as chloride in rock salt, also in sea-water and saline springs ; also in deposits, as sodium nitrate and borate.

**What is sodium hydrate ?**

Sodium hydrate or hydroxide, also termed caustic soda,  $\text{NaOH}$ , is a white, crystalline substance, usually found in the market in cylindrical sticks presenting radiating crystalline fractured surfaces, attracts moisture, and on exposure changing on the surface to sodium carbonates. Its solution in water is known as soda lye, the officinal solution as liquor sodæ.

**What are the properties of liquor sodæ, and how is it prepared ?**

It is an aqueous 5 per cent. solution of  $\text{NaOH}$ , sp. gr. 1.059. 20 grams should not require less than 25 c.c. of volumetric solution of oxalic acid for neutralization ; it belongs to the caustic alkaline poisons, producing the same symptoms as KOH and requiring the same antidote. It is prepared similarly as KOH from  $\text{Na}_2\text{CO}_3$  and  $\text{Ca}(\text{OH})_2$  ;  $\text{Na}_2\text{CO}_3 + \text{Ca}(\text{OH})_2 = \text{CaCO}_3 + 2\text{NaOH}$ .

**What is the respective physiological effect of potassium, and what of sodium compounds?**

Potassium compounds are heart and muscle poisons, while those of sodium are inert.

**What is the chlorine compound of sodium?**

Sodium chloride, common or table salt, NaCl, crystallizing in transparent cubes, sp. gr. 2.13, soluble in about 3 parts of water.

**What is the function of NaCl in the animal economy?**

It is found in all tissues and liquids of the body, especially in the blood. It is ingested with the food and principally eliminated by the kidneys. In the tissues it tends to promote cell nutrition by conducting the osmotic process; it appears in all excretions but chiefly in the urine.

**In what quantities is NaCl, or chlorides represented by it, eliminated in 24 hours?**

The total chlorides of the urine eliminated in 24 hours, consisting principally of sodium and potassium chlorides, average about 12-16 grams.

**What influences the amount of chlorides present in the urine?**

The amount ingested, also the condition of health; thus in febrile diseases they are diminished, especially when these are due to inflammatory exudations; *e. g.*, in pneumonia, they may be almost or totally absent and reappear with a limitation of the inflammatory process.

**How is the presence of chlorides in the urine demonstrated?**

By adding first a few drops of HNO<sub>3</sub>, to prevent the precipitation of the phosphates, and then adding a solution of silver nitrate, when a more or less dense precipitate of silver chloride will indicate approximately the amount of chlorides present:  
 $\text{NaCl} + \text{AgNO}_3 = \text{NaNO}_3 + \text{AgCl}$ .

**How are the chlorides in the urine volumetrically determined?**

With a solution of silver nitrate standardized to precipitate accurately 0.01 NaCl for each c.c. (29.06 AgNO<sub>3</sub> to 1 liter H<sub>2</sub>O.)

**Describe the process for determining volumetrically the amount of chlorides in urine.**

Dilute 10 c.c. urine with 50 c.c. water in a porcelain dish or beaker, add a few drops of neutral potassium chromate solution to give it a distinctly lemon-yellow color. Allow the silver nitrate solution to gradually flow into it, while stirring, until the urine turns permanently orange-red. Each c.c. of the silver solution used indicates 0.01 NaCl present in the 10 c.c. urine, or ten times the total number of c.c. the percentage of chlorides expressed in NaCl, subtracting one c.c AgNO<sub>3</sub> solution for supersaturation.

**If the urine is highly colored or putrid or albuminous, what should first be done?**

The organic matter should be oxidized with potassium permanganate solution gradually added while boiling until a faint pink hue remains ; the resulting manganese sesquioxide is then filtered off, the quantity brought up to the original volume with distilled water, and proceeded with as above.

**What is sodium bromide?**

A binary compound of sodium and bromine NaBr, soluble in 1.13 parts of water at 20° C., and representing 77.67 per cent. Br.

**What binary compound does Na form with I?**

Sodium iodide NaI, dissolves in 56 parts of water at 20° C., and represents 84.6 per cent. iodine.

**What is sodium hypochlorite, and in what preparation is it contained?**

Sodium hypochlorite, NaClO, is contained in the liquor sodae chloratae or Labarraque's solution, prepared by decomposing a saturated solution of chlorinated lime with a solution of sodium carbonate. It is a powerful bleaching and disinfecting agent.

**Give the formulæ of the chlorate, bromate, and iodate of sodium.**

Sodium chlorate NaClO<sub>3</sub>, sodium bromate NaBrO<sub>3</sub>, sodium iodate NaIO<sub>3</sub>.

**Which is the principal sulphate of sodium?**

The neutral sodium sulphate Na<sub>2</sub>SO<sub>4</sub> known as Glauber's salt,

crystallizing in large efflorescent prisms, which melt in their water of crystallization when heated.

**How do the sulphates get into the blood, and how are they eliminated?**

The sulphates of potassium and of sodium are in part directly derived from the foods, and also together with organic sulphur compounds from the oxidation of the albuminoids of the body. They are eliminated by the urine in quantities of about 3 to 4 grams in 24 hours.

**How may the sulphates of the urine be demonstrated and approximated?**

By acidulating the urine with a few drops of HCl and then adding a solution of barium chloride which causes a white precipitate; this may be compared for approximation with that from a known normal specimen of urine.

**How are the sulphates determined volumetrically?**

By acidulating 100 c.c. urine with HCl and boiling it. Into this drop gradually from a burette the standard solution of barium chloride ( $30.5\text{ BaCl}_2$  in  $1000\text{ H}_2\text{O}$ ), until no further precipitate ensues, testing this frequently to attain accurate results. Each c.c. of the  $\text{BaCl}_2$  solution used corresponds to 0.01 grm.  $\text{SO}_4^{2-}$ , the total number of c.c.  $\text{BaCl}_2$  used gives at once the percentage.

**What are sodium sulphite and hyposulphite?**

Sodium sulphite  $\text{Na}_2\text{SO}_3$ , the salt resulting when the H in  $\text{H}_2\text{SO}_3$  is replaced by Na. Sodium hyposulphite  $\text{Na}_2\text{S}_2\text{O}_3$  is a reducing agent and a disinfectant.

**Which are the principal sodium phosphates?**

The disodium phosphate or neutral sodium phosphate  $\text{Na}_2\text{HPO}_4$ , sodii phosphas U. S., slightly alkaline; and the mono-sodium phosphate or acid sodium phosphate  $\text{NaH}_2\text{PO}_4$  of acid reaction.

**When  $\text{Na}_2\text{HPO}_4$  is heated what forms?**

It loses water and forms sodium pyrophosphate  $\text{Na}_4\text{P}_2\text{O}_7$ .

**Where is the  $\text{Na}_2\text{HPO}_4$  found in the body and where the  $\text{NaH}_2\text{PO}_4$ ?**

The  $\text{Na}_2\text{HPO}_4$  is found in all the tissues and liquids of the body but is converted into the  $\text{NaH}_2\text{PO}_4$  by the  $\text{NaHCO}_3$  of the blood and eliminated as such in the urine, to which the latter owes its normal acid reaction.  $\text{Na}_2\text{HPO}_4 + \text{NaHCO}_3 = \text{NaH}_2\text{PO}_4 + \text{Na}_2\text{CO}_3$ .

**Which are the two principal carbonates of sodium?**

Sodium carbonate, sal soda, washing soda,  $\text{Na}_2\text{CO}_3$ , and hydro-sodium carbonate, acid sodium carbonate, also sodium bicarbonate,  $\text{NaHCO}_3$ .

**What is sodium carbonate? Where and how obtained?**

Sodium carbonate is found free in nature, but mostly manufactured on a large scale from sodium chloride. It is a salt crystallizing with 10 Aq, in large efflorescent crystals, has a strong alkaline reaction and yields  $\text{CO}_2$  when treated with acids.

**What is sodium bicarbonate?**

A salt manufactured by treating  $\text{Na}_2\text{CO}_3$  with  $\text{CO}_2$  ( $\text{Na}_2\text{CO}_3 + \text{CO}_2 + \text{H}_2\text{O} = 2\text{NaHCO}_3$ ), of feeble alkaline reaction, giving up  $\text{CO}_2$  on heating and boiling forming  $\text{Na}_2\text{CO}_3$ ; it crystallizes without water entering its molecule.

**What officinal preparations does  $\text{NaHCO}_3$  enter?**

The soda powders (pulveres effervescentes) and the Seidlitz powders (pulveres effervescentes aperientes); the former containing  $\text{NaHCO}_3$  and tartaric acid in different papers, the latter  $\text{NaHCO}_3$  with Rochelle salt and tartaric acid, also in two separate papers.

**How is  $\text{NaHCO}_3$  used in baking?**

To aerate, i. e., raise the bread, hence its name saleratus or baking powder. It should be mixed for this purpose with either cream of tartar or tartaric acid sufficient to change it into a neutral tartrate, while the  $\text{CO}_2$  given off will render the bread light and spongy.

**What is Rochelle salt?**

Sodium potassium tartrate  $\text{NaKT}\bar{\text{T}} + 4\text{Aq}$ . A double salt of

tartaric acid, in which one H is replaced by K and the other by Na. It is prepared by neutralizing cream of tartar with sodium carbonate; it crystallizes in large transparent prisms, and is readily soluble in water.

### How are sodium compounds recognized?

They are almost all readily soluble in water; inserted into a non-luminous flame they give rise to a yellow coloration, and, viewed through the spectroscope, they exhibit a yellow line.

## Lithium.

### What is lithium?

An elementary metal Li, a. w. 7, sp. gr. 0.59; the lightest of all metals known; found in compounds in various minerals and in the waters of some mineral springs.

### What is lithium carbonate?

Lithium carbonate  $\text{Li}_2\text{CO}_3$ ; a valuable antacid, rendering the urine alkaline, and forming soluble lithium urate with uric acid. It is a white, pulverulent substance, very little soluble in plain water, but considerably more so in carbonic acid water.

### What is lithium bromide, and what its advantages over other bromides?

Lithium bromide LiBr is a crystalline substance, very deliquescent, containing more bromine than any other bromide (91.95 per cent.).

### What are the characteristic flame reactions of Li compounds?

They produce, when inserted into non-luminous flames, a bright-red coloration, which, when viewed through a spectroscope, causes an intense red line in the spectrum.

## Ammonium.

### Why should ammonium, $\text{NH}_4$ , be considered with the metals of the alkalis?

Because it shows in its chemical action much similarity to them, forming salts like them, and can be converted into an amalgam with mercury,  $\text{NH}_4\text{Hg}$ .

**What is ammonium hydrate?**

$\text{NH}_4\text{OH}$ , formed by passing gaseous ammonia  $\text{NH}_3$  into water,  $\text{NH}_3 + \text{H}_2\text{O} = \text{NH}_4\text{OH}$ ; a clear liquid, of strong ammoniacal odor, lighter than water, of a strong alkaline reaction, which, on heating, is decomposed into  $\text{NH}_3$  and  $\text{H}_2\text{O}$ .

**What is aqua ammoniæ, and what aqua ammoniæ fortior U. S.?**

Aqua ammoniæ is an aqueous solution of  $\text{NH}_3$ , sp. gr. 0.950, containing 10 per cent. by weight of the gas. Aqua ammoniæ fortior is the same, but has a sp. gr. 0.900, and contains 28 per cent. by weight of the gas.

**To what class of poisons does  $\text{NH}_3\text{OH}$  belong?**

To the caustic alkalies, producing the symptoms of these with greater respiratory disturbances, and requiring the antidotes already mentioned for this class (see Potassium hydrate).

**Which are the principal halogen compounds of  $\text{NH}_3$ ?**

Ammonium chloride  $\text{NH}_4\text{Cl}$ , ammonium bromide  $\text{NH}_4\text{Br}$ , ammonium iodide  $\text{NH}_4\text{I}$ .

**How is  $\text{NH}_4\text{Cl}$  prepared, and what are its properties?**

Muriate of ammonia or sal ammoniac  $\text{NH}_4\text{Cl}$  is prepared by neutralizing  $\text{NH}_3\text{OH}$  with  $\text{HCl}$ ;  $\text{NH}_3\text{OH} + \text{HCl} = \text{NH}_4\text{Cl} + \text{H}_2\text{O}$ ; crystallizes in small feather-like forms, of a sharp, salty taste; dissolves readily in water, and sublimes without melting; heated with  $\text{KOH}$ ,  $\text{NaOH}$  or  $\text{Ca(OH)}_2$ , it gives off  $\text{NH}_3$ .

**What is ammonium hydrosulphide and its use?**

Ammonium sulphhydrate,  $\text{NH}_4\text{HS}$ , is a compound produced by saturating  $\text{NH}_3\text{OH}$  with  $\text{H}_2\text{S}$ ; it is at first colorless, but becomes yellow. It is principally employed as a precipitant in the laboratory for analytical purposes.

**What is ammonium sulphate?**

$(\text{NH}_4)_2\text{SO}_4$ , obtained by saturating  $\text{NH}_3\text{OH}$  with  $\text{H}_2\text{SO}_4$ ; a crystalline salt, readily soluble in water.

**What is ammonium nitrate, and its use?**

$\text{NH}_4\text{NO}_3$ , a salt produced by neutralizing  $\text{NH}_3\text{OH}$  with  $\text{HNO}_3$ , and crystallizing from its solutions in long six-sided prisms. It

is very soluble in water, and fuses at 150° C., decomposing at 210° into nitrous oxide  $N_2O$  and water; this is utilized for the production of nitrous oxide for anaesthesia.

### Where is ammonium nitrite found, and how formed?

It is found in the air after thunder-storms and in rain-water, resulting from the action of the electric spark on moist air.

### Which are the carbonates of ammonium?

Neutral ammonium carbonate  $(NH_4)_2CO_3$  decomposes readily into  $NH_3$  and acid ammonium carbonate  $NH_4HCO_3$ . The ammonium carbonas U. S., or so-called ammonium sesquicarbonate, also sal volatile, is a mixture of the acid ammonium carbonate with ammonium carbamate  $(NH_4HCO_3 + NH_4NH_2CO_2)$ .

### How can ammonium compounds be recognized?

They are colorless, volatile, and give off  $NH_3$  when treated with bases. This may be recognized with moist litmus paper, which turns blue. With platinum chloride they give a yellow, crystalline precipitate.

## Metals of the Alkaline Earths.

### Which are the metals composing this group?

Calcium, strontium, barium.

### What are the characteristics of the metals of this group?

They are divalent, form basic hydrates, and insoluble carbonates, phosphates, and sulphates.

## Calcium.

### What is calcium?

A light-yellowish metal Ca, a. w. 39.9, sp. gr. 1.5778, decomposes water, and burns with a bright light. It is abundant throughout nature in its compounds, principally as carbonate.

### What is the principal calcium oxide, and how prepared?

Calcium oxide, also termed lime or quicklime, calx U. S.  $CaO$  is prepared from the native calcium carbonate  $CaCO_3$  (lime-

stone or marble), by heating it in kilns for that purpose.  $\text{CaCO}_3 = \text{CaO} + \text{CO}_2$ . From the air it attracts  $\text{CO}_2$  and again forms  $\text{CaCO}_3$ .

### **Slaked lime, what is it chemically, and how obtained ?**

Slaked lime or calcium hydrate  $\text{Ca(OH)}_2$  is a white amorphous powder, forming a milky paste with water (milk of lime), and dissolves in cold water, about 1 part in 760 ; this is termed lime-water, liquor calcis U. S., and prepared by the action of water on  $\text{CaO}$  ;  $\text{CaO} + \text{H}_2\text{O} = \text{Ca(OH)}_2$ .

### **What is syrupus calcis ?**

A solution of  $\text{Ca(OH)}_2$  in sugar and water. The addition of sugar makes the  $\text{Ca(OH)}_2$  very much more soluble, 1 fluidounce containing about 8 grains.

### **If lime is taken in substance, what is the effect, and what the antidotes ?**

It acts as a caustic poison. Antidotes : diluted acids and oils.

### **What is calcium fluoride ?**

Fluorite or fluor-spar  $\text{CaF}_2$ , used for obtaining hydrofluoric acid  $\text{HF}_2$ .

### **What are the compounds of Ca with Cl, Br, and I ?**

Calcium chloride  $\text{CaCl}_2$ , calcium bromide  $\text{CaBr}_2$ , calcium iodide  $\text{CaI}_2$ .

### **How is calcium chloride prepared and how used ?**

It is prepared by the action of  $\text{HCl}$  on  $\text{CaCO}_3$  ;  $\text{CaCO}_3 + 2\text{HCl} = \text{CaCl}_2 + \text{H}_2\text{CO}_3$ . It is a crystalline deliquescent salt, which, when heated, loses its water of crystallization and appears in a fused state ; it is used for freezing mixtures, also for desiccating gases.

### **What is chlorinated lime ?**

Bleaching powder or calx chlorata is probably a mixture of calcium hypochlorite  $\text{Ca}(\text{ClO})_2$  and calcium chloride  $\text{CaCl}_2$ , or  $\text{CaClClO}$  ; it is prepared by passing chlorine over slaked lime :

and is used principally as a bleaching and disinfecting agent, depending on the liberation of Cl by H<sub>2</sub>CO<sub>3</sub> of the air or by other acids admixed with it.

**Calx sulphurata U. S., what is it?**

A mixture of calcium sulphide CaS and calcium sulphate CaSO<sub>4</sub>, prepared by heating together lime and precipitated sulphur.

**What is calcium sulphate, and in what form is it generally used?**

Calcium sulphate in its crystalline form is known as gypsum CaSO<sub>4</sub>+2H<sub>2</sub>O, and when dehydrated by calcination is known as plaster of Paris, used for fixed surgical dressings, as on mixing with water it again assumes its hydrated crystalline state.

**What compounds does Ca form with phosphoric acid?**

The acid calcium phosphate or monocalcium phosphate, also termed superphosphate of lime, Ca(H<sub>2</sub>PO<sub>4</sub>)<sub>2</sub>; the di-calcium phosphate Ca(HPO<sub>4</sub>)<sub>2</sub>+2H<sub>2</sub>O, and the tricalcium phosphate or neutral calcium phosphate, also termed bone phosphate and precipitated phosphate of calcium Ca<sub>3</sub>(PO<sub>4</sub>)<sub>2</sub>.

**Which of the three calcium phosphates is principally found in the body, and what part thereof?**

All three are found in the body, but principally the neutral salt, which is contained in a large amount in the bones and the teeth; it is sometimes found in the urine, the acid salt being always present therein and forming there along with the magnesium phosphate the so-called earthy phosphates.

**What is the total elimination of phosphoric acid by the urine in 24 hours, and what part of the phosphates so eliminated are phosphates of the alkalies, and how much earthy phosphates?**

The total elimination of phosphoric acid in the form of phosphates is about 2-3 grams in 24 hours, two-thirds of which are alkaline and one-third earthy phosphates.

**How can the earthy phosphates of the urine be separated?**

By rendering the urine alkaline with KOH or NaOH, when,

on heating, the earthy phosphates will separate out in flakes, and then can be removed by filtration.

**After separation of the earthy phosphates how can the alkaline phosphates be precipitated?**

By adding to the filtrate one-third of its volume of magnesia mixture the alkaline phosphates will be precipitated.

**How can the total amount of phosphoric acid in urine be readily approximated?**

By Teissier's method ; in a graduated cylindrical vessel add 50 c.c. urine and 15 c.c. magnesia mixture, shake together and let stand for 24 hours, each c.c. of the deposit will represent approximately 0.30 grams  $P_2O_5$  per liter or 0.03 per cent. thereof.

**How is the total amount of phosphoric acid in urine determined by the volumetric process?**

Take 50 c.c. urine in a suitable vessel, add 15 c.c. acidulated solution of sodium acetate and heat to the boiling point ; then drop into the mixture from a burette, drop by drop, a standardized solution of uranium acetate (1 c.c. to represent 0.005  $P_2O_5$ ). Test frequently by dropping some of the heated mixture into a solution of potassium ferrocyanide ; when a chocolate color precipitate begins to appear the process is finished. For each c.c. of the uranium acetate solution used count 0.005 grams  $P_2O_5$  in the 50 c.c. urine, or twice as much to get the percentage.

**How does calcium carbonate occur in nature?**

$CaCO_3$  is abundant and in vast deposits known as chalk, limestone, and marble ; it is also found crystalline as calc-spar, Iceland spar, and arragonite ; the shells of crustacea, of birds' eggs, corals, and the bones and teeth of animals contain it.

**What are the officinal forms of  $CaCO_3$ ?**

Precipitated chalk, calcii carbonas præcipitatus U. S., prepared by precipitating a solution of  $CaCl_2$  with  $Na_2CO_3$ , and prepared chalk, creta preparata U. S., a native friable calcium carbonate freed from most impurities by elutriation.

**What are the properties of  $CaCO_3$ ?**

It is almost insoluble in pure water, but soluble in water con-

taining  $H_2CO_3$ , forming probably calcium hydrocarbonate or acid carbonate, also called bicarbonate of calcium. As many waters, streams, and springs are strongly impregnated with  $H_2CO_3$  they hold  $CaCO_3$  in solution and deposit it on evaporation, as illustrated by the formation of stalactites.

**By which analytical reactions are calcium compounds recognized?**

Solutions of calcium salts are precipitated by alkaline carbonates and phosphates ; ammonium oxalate gives a white precipitate with them, insoluble in weaker acids, but soluble in strong HCl or  $HNO_3$ . With sodium tungstate they give dense white precipitates. Calcium salts color a non-luminous flame red.

### Barium.

**In which form does barium occur in nature, and what are its symbol and a. w. ?**

Barium is found exclusively as a native sulphate, which, on account of its great weight, is also called heavy spar and barytes ; the native carbonate is termed witherite. The symbol of barium is Ba ; a. w. 137 ; sp. gr. 3.6.

**What are the oxides and what is the hydrate of barium ?**

There are two, barium oxide, also called baryta  $BaO$ , and barium peroxide  $BaO_2$ , used in making hydrogen peroxide. When barium oxide is dissolved in water it forms barium hydrate or hydroxide  $Ba(OH)_2$ , the solution being known as baryta water, which is strongly alkaline, and is rendered turbid by  $CO_2$ , insoluble  $BaCO_3$  being formed.

**What are the compounds of Ba with Cl and with  $HNO_3$ , and their use ?**

Barium forms a soluble crystallizable barium chloride,  $BaCl_2$ , with Cl, with  $HNO_3$  it forms a soluble crystallizable barium nitrate  $Ba(NO_3)_2$ ; both of these salts are used for the detection and determination of sulphuric acid and soluble sulphates.

**What is the action of the soluble barium salts on the human economy ?**

They are actively poisonous. Antidotes : soluble sulphates.

**How are the barium compounds recognized?**

Their solutions give white precipitates with alkaline carbonates, also heavy white precipitates with  $H_2SO_4$  or soluble sulphates, insoluble in acids, white precipitates with alkaline phosphates soluble in  $HNO_3$ ; they color a non-luminous flame green.

**Magnesium Group.****Which are the principal metals of interest in this group, and what are their common characteristics?**

Magnesium, Mg, Zinc, Zn, Cadmium, Cd. They are all dyads forming but one oxide and one sulphide. Their oxides and hydroxides are almost all insoluble in water; they form soluble sulphates and insoluble carbonates and phosphates.

**Magnesium.****What is magnesium?**

A bright silver-white metal, Mg, a. w. 24, sp. gr. 1.75, burns when ignited with intense white light to magnesium oxide,  $MgO$ , dissolves readily in dilute acids forming salts, and is not attacked by alkalies.

**When and how does magnesium occur in nature?**

Its compounds abound in nature as carbonate, as silicate in talcum, soapstone, asbestos, and meerschaum, as soluble salts in most natural waters, and largely so in sea-water and some mineral springs; they are also present in the economy into which they enter by the foods and water, and are eliminated by the urine as phosphate.

**What is magnesium oxide?**

Magnesia or calcined magnesia  $MgO$ , obtained by calcining the hydrate or carbonate: a white, voluminous, amorphous powder, very insoluble in water; two varieties are used in medicine, of which the former is known as magnesia or magnesia levis, while the heavier article is known as magnesia ponderosa.

**What is magnesium hydrate?**

Magnesium hydrate or hydroxide  $Mg(OH)_2$  is the precipitate resulting when a solution of a magnesium salt is decomposed by the hydrate of potassium or sodium ; in suspension with water it is known as milk of magnesia.

**What is magnesium chloride?**

A very deliquescent salt  $MgCl_2$ , present in many mineral springs, and in some impure grades of table salt.

**What is magnesium sulphate?**

Magnesium sulphate, Epsom salt  $MgSO_4 + 7Aq$ , found in sea-water and in a number of mineral springs. It crystallizes in four-sided rhombic prisms, is readily soluble in water, has a bitter, saline taste, and finds much use as an aperient.

**Which are the principal phosphates of magnesium?**

The tri-magnesium phosphate  $Mg_3(Po_4)_2$  in bones, the mono-magnesium phosphate  $MgHPO_4 + 7Aq$  present in the urine; when it meets ammonium compounds, it forms the ammonium-magnesium phosphate  $MgNH_4PO_4 + 6Aq$ , also termed triple-phosphate.

**What is the cause of the formation of triple-phosphate in the urine, and what is its significance?**

When urine is decomposed by putrefactive change ammonium carbonate is formed,  $CONH_4 + H_2O \rightleftharpoons (NH_4)_2CO_3$ ; this with magnesium phosphate yields ammonium-magnesium phosphate,

which separates out in microscopic prismatic crystals resembling coffin lids. If these occur persistently, the liability to formation of fusible or triple-phosphate calculi arises.

**Which are the principal carbonates of magnesium?**

Neutral magnesium carbonate  $MgCO_3$ , which occurs in nature as magnesite. The magnesii carbonas of the Pharmacopœia is a mixture of magnesium carbonate with magnesium hydrate ( $MgCO_3, Mg(OH)_2 + 5H_2O$ ) ; a white voluminous powder, usually offered in the market as light-white cubes. This, when suspended

in water and carbon dioxide, is passed through it, dissolves and forms what is known as liquor magnesii carbonatis or fluid magnesia.

### **How are magnesium compounds recognized?**

The alkaline hydrates precipitate from their solutions magnesium hydrate, the carbonates basic magnesium carbonate ; the precipitates are insoluble in water, but soluble in solutions of ammonium salts from which di-sodium phosphate precipitates ammonium-magnesium phosphate.

## **Zinc.**

### **What is zinc?**

A bluish-white metal, Zn, a. w. 65, of crystalline fracture, sp. gr. 7-7.2; fuses at 412° C., and distils at about 1000° C. It is soluble in dilute acids with liberation of H<sub>2</sub>, also in KOH or NaOH on boiling, when it yields H<sub>2</sub> as with acids.

### **What is zinc hydrate?**

A white amorphous powder Zn(OH)<sub>2</sub>, precipitated by the decomposition of a zinc salt solution with an alkaline hydrate, in an excess of which it is freely soluble.

### **What is zinc oxide?**

A white, tasteless powder, ZnO, insoluble in water, but freely soluble in acids, with which it forms salts; it turns yellow on heating, and white again on cooling. It is largely used in the arts for paint, as it will not darken on exposure to H<sub>2</sub>S like the lead pigment; it is also employed in medicine, both internally as well as externally, in the unguentum zinci oxidii.

### **What is the chlorine compound of zinc?**

Zinc chloride ZnCl<sub>2</sub>, a white deliquescent fusible substance; it is a painful caustic; in solution, containing 50 per cent., it is known as liquor zinci chloridi; it is used as a flux for solder, also as a disinfectant (Burnett's disinfecting fluid); diluted it serves as a soft injection for the preservation of dead bodies.

### **What is the toxic action of ZnCl<sub>2</sub>, and its antidote?**

It coagulates albumen, hence its corrosive action, and again

by absorption it manifests its specific action on the nerve centres, paralyzing motion, and causing tremor and coma. Antidotes : milk, eggs, and vegetable astringents.

**What sulphide do neutral solutions of zinc salts yield with H<sub>2</sub>S?**

A white zinc sulphide ZnS.

**What is zinc sulphate ?**

White vitriol ZnSO<sub>4</sub>, crystallizing with 7Aq in rhombic crystals, resembling those of magnesium sulphate ; it forms insoluble compounds with albumen and milk ; it is a rapid, non-depressing emetic in doses of gr. xx-xxx.

**How may the compounds of zinc be recognized ?**

Their solutions give a white precipitate with alkaline hydrates, soluble in excess; K<sub>2</sub>CO<sub>3</sub> and Na<sub>2</sub>CO<sub>3</sub> white precipitate, insoluble in excess ; (NH<sub>4</sub>)<sub>2</sub>CO<sub>3</sub> white precipitate soluble in excess ; H<sub>2</sub>S white precipitate from neutral solutions ; ammonium sulphhydrat white precipitate, insoluble in excess of it, as well as in KOH, or NaOH, or NH<sub>4</sub>OH ; potassium ferrocyanide white precipitate, insoluble in HCl.

## Lead Group.

**Which are the metals of this group ?**

Lead and thallium.

### Lead.

**What is lead ?**

A bluish-white heavy metal, Pb, a. w. 207, soft and ductile, of bright lustre on freshly-cut surface, becoming tarnished after exposure ; sp. gr. 11.37 ; fuses at 325° C. ; forms alloys with other metals ; among these is type-metal, composed of lead and antimony, and soft solder of lead and tin.

**What is the principal source of lead ?**

Galena, a native lead sulphide, from which it is separated by roasting.

**What is the action of water on metallic lead?**

Pure water does not act on lead, but by the action of air and water, alternately, it becomes coated with lead hydrate  $\text{Pb}(\text{OH})_2$ , which is somewhat soluble in water; thus new lead pipes may give rise to the contamination of water. If the water contains  $\text{CO}_2$  and salts, the lead becomes coated with insoluble carbonate and sulphate, and old pipes therefore give greater immunity from contamination; however, by an excess of  $\text{CO}_2$ , the carbonate may be rendered slightly soluble. The presence of nitrates and nitrites in water conducted through lead pipes also tends to produce lead contamination in water.

**What is lead hydrate?**

$\text{Pb}(\text{OH})_2$ ; a white precipitate thrown out from solutions of lead salts by alkaline hydrates; it renders water alkaline, and forms lead carbonate with  $\text{CO}_2$ .

**Which are the principal oxides of lead?**

Lead monoxide,  $\text{PbO}$  or litharge, lead peroxide or dioxide  $\text{PbO}_2$ , plumboso-plumbic oxide  $\text{Pb}_3\text{O}_4$  or minium.

**What is lead monoxide?**

$\text{PbO}$ , litharge, is the officinal plumbi oxidum, produced by heating lead in the air, is a reddish-yellow substance, of rhombic scales, or when obtained as yellow amorphous powder it is known as massicot. It has strong basic properties, saponifies fats, producing with olive oil the emplastrum plumbi U. S., melts at red heat, and unites with silicic anhydride to form lead glass; it is employed thus to make the glaze on pottery; it is also used as a dryer for paints; it dissolves in water as hydrate, rendering it alkaline, and absorbs then  $\text{CO}_2$ ; it also dissolves in hot solutions of KOH and NaOH, from which it crystallizes on cooling.

**What is lead peroxide?**

Lead peroxide or dioxide,  $\text{PbO}_2$ ; a brown amorphous powder remaining when minium is treated with  $\text{HNO}_3$ . It has acid properties uniting when warmed with KOH to form potassic plumbate,  $\text{K}_2\text{PbO}_3 + 3\text{Aq}$ .

**What is minium ?**

Red lead or minium is a bright red powder  $Pb_3O_4$ , a compound of lead oxide with lead peroxide  $(PbO)_2PbO_2$ . It is obtained by heating litharge to 300-400° C. in the air; it is used as a pigment for red paint.

**What is lead chloride ?**

$PbCl_2$ , the white precipitate resulting by adding HCl or a soluble chloride to solutions of lead salts. It is very little soluble in cold water, soluble in 30 parts of hot water, from which it crystallizes on cooling.

**What is lead iodide ?**

$PbI_2$ , the yellow precipitate resulting from solutions of lead salts when treated with potassium iodide; little soluble in cold but more freely soluble in boiling water, from which it crystallizes on cooling in beautiful six-sided plates discernible under the microscope; it is readily soluble in KOH.

**When solutions of lead salts are treated with H<sub>2</sub>S what results ?**

Lead sulphide  $PbS$ , a black amorphous powder, insoluble in dilute acids. In nature  $PbS$  occurs in cubic crystals of a metallic lustre, and is commonly known as galena.

**If sulphuric acid or soluble sulphates are added to solutions of lead salts what results ?**

Lead sulphate  $PbSO_4$ , a white powder almost insoluble in water.

**What is lead nitrate ?**

$Pb(NO_3)_2$ , a crystalline salt resulting when lead is treated with  $HNO_3$ ; it dissolves in 8 parts of water, and as such forms a disinfecting fluid called Ledoyen's solution.

**When to a solution of lead salt potassium chromate is added what is formed ?**

Lead chromate, chrome yellow,  $PbCrO_4$ , a bright yellow amorphous powder, insoluble in weaker acids but readily soluble in KOH. It is used largely in the arts as a pigment, and has been used with fatal effect to give buns and cakes the yellow color of eggs.

**Which is the principal lead salt used in medicine?**

Lead acetate or sugar of lead  $Pb(C_2H_3O_2)_2 + 3 Aq.$  also termed saccharum saturni, crystallizing in large, colorless prisms, of sweetish taste, acitous odor, acid reaction, and efflorescent on exposure ; with water containing  $CO_2$  it makes turbid solutions, lead carbonate being precipitated.

**For what purposes is lead acetate usually employed?**

In medicine as a sedative and astringent ; it is generally found as an ingredient in the different hair-color restorers, and while not very actively poisonous itself it may become so if its use in such a manner is persistently continued.

**When lead acetate in solution is boiled with lead oxide,  $PbO$ , what results?**

The  $PbO$  is dissolved and a solution of lead subacetate or basic lead acetate is formed, which is known as the liquor plumbi subacetatis U. S., also termed Goulard's extract ; when diluted it is known as the liquor plumbi subacetatis dilutus or lead water.

**What is neutral lead carbonate?**

Lead carbonate  $PbCO_3$  is a white amorphous powder, different commercial forms of which are known as white lead, flake white, crennitz white, etc., which are basic varieties ; such is also the plumbi carbonas U. S.  $(PbCO_3)_2Pb(OH)_2$ .

**For what purpose is the lead carbonate employed?**

Principally as pigment and base for oil paints, for making plumber's joints, in medicine in ointment form, for glaze of paper, and frequently as a most objectionable cosmetic. It is the most poisonous of the lead compounds.

**What are the symptoms of acute lead poisoning?**

Metallic taste, thirst, colic, constipation, cramps, urinary suppression, convulsions, but the mind is preserved to the last.

**Is the prognosis in acute lead poisoning favorable, and what is the treatment for it?**

Prognosis in such cases is generally favorable ; treatment should consist of emetics or stomach-pump followed by either

magnesium or sodium sulphate and sulphuric acid lemonade to produce insoluble lead sulphate together with morphine for pain.

**From what sources may chronic plumbism arise ?**

From drinking water or beer conducted through new leaden pipes, inhalation of, or absorption by the skin of white lead or paints, from snuff or chewing tobacco wrapped in lead, from lead-glazed pottery, from contact with lead or lead compounds as in plumbers, painters, lead workers, miners, type founders, also from cosmetics and hair restorers containing lead, and even from hat linings or biting off silk weighted with lead.

**What are the symptoms of chronic plumbism ?**

Indigestion, colic and constipation, cachexia, ptyalism, weakness of muscles of forearm, lead palsy, wrist drop, paralysis of extensor muscles with atrophy of extensor and interosseous muscles ; blue lines arising from deposit of PbS on the gums due to the presence of H<sub>2</sub>S in the breath and decaying food ; arthralgia, encephalopathy, spasms, mania, melancholia, convulsions, coma.

**What is the treatment of chronic plumbism ?**

To clear out the alimentary tract with MgSO<sub>4</sub> or Na<sub>2</sub>SO<sub>4</sub>, also potassium iodide, tincture of iron, and galvanism.

**How can lead compounds be recognized ?**

They give from acid solutions a black precipitate with H<sub>2</sub>S, insoluble in acids, also with NH<sub>4</sub>H<sub>2</sub>S insoluble in excess. With sulphuric acid or soluble sulphates a white precipitate ; with potassium iodide a yellow precipitate, also with potassium chromate.

**How is urine or other liquids, suspected to contain lead, to be tested ?**

Concentrate to dryness and incinerate ; dissolve residue in HNO<sub>3</sub> and evaporate solution to dryness over a water bath, dissolve in distilled water and test with H<sub>2</sub>S. The sulphide, if sufficient, may then be reduced by the blow-pipe to a malleable particle of lead, or it may be dissolved in HNO<sub>3</sub>, the acid evapo-

rated and residue dissolved in distilled water to be tested with KI, when the lead iodide, after heating, will be seen under the microscope as six-sided plates.

## Copper Group.

Of what metals does this group consist ?

Copper, mercury, and silver.

### Copper.

What is copper ?

A reddish-brown metal Cu, a. w. 63.2, soft and ductile, sp. gr. 8.9, unaltered in dry air, with moisture it is coated with green copper carbonate ; on heating it oxidizes to black cupric oxide. Dilute HCl or H<sub>2</sub>SO<sub>4</sub>, does not act on it, but the stronger acids dissolve it to form salts.

Which are the principal alloys of copper ?

Brass =Cu+Zn ; bronze Sn or Pb or Zn+Cu ; bell metal Sn+Cu ; German silver Cu+Zn+Ni.

What two classes of compounds does copper form ?

Cupric and cuprous ; monatomic in the cupric and diatomic in its "ous" compounds ; the molecules of the latter, however, are to be regarded as double formulas.

Thus Cu=O, Cu=Cl, Cu=(OH), Cu=SO<sub>4</sub> ; "ic" compounds.

What is cupric hydrate, and how derived ?

A greenish-blue precipitate resulting when a solution of a copper salt is treated with sodium or potassium hydrate. Cu(OH)<sub>2</sub>. It readily changes into black cupric oxide when heated. Cu(OH)<sub>2</sub>=CuO+H<sub>2</sub>O.

What is cupric oxide ?

A black amorphous powder CuO, forming when Cu(OH)<sub>2</sub> is heated as above, also by oxidation of copper turnings in the

air. By heating it reduces carbon compounds forming carbon dioxide and water of them. It dissolves in the alkaline hydrates with a dark blue color, directly with  $\text{NH}_3\text{OH}$ , and in the presence of organic substances with KOH or NaOH. In the presence of glucose it is reduced at the boiling point to  $\text{Cu}_2\text{O}$ .

### What is cuprous oxide?

A bright and crystalline powder  $\text{Cu}_2\text{O}$ , forming when a solution of CuO in NaOH or KOH is boiled in the presence of grape sugar.

### Which are two chlorides of copper?

Cupric chloride  $\text{CuCl}_2$  and cuprous chloride  $\text{Cu}_2\text{Cl}_3$ . The latter dissolved in  $\text{NH}_3\text{HO}$  has the property of absorbing carbon monoxide, and is used for the analysis of that gas.

### What precipitate does $\text{H}_2\text{S}$ yield with copper solutions?

A brownish-black precipitate of copper sulphide  $\text{CuS}$ .

### Describe the sulphuric acid compound of copper.

Copper sulphate or sulphate of copper, also blue vitriol or bluestone  $\text{CuSO}_4 + 5\text{H}_2\text{O}$ , is formed by the action of strong  $\text{H}_2\text{SO}_4$  on copper. It is a blue crystalline efflorescent salt, giving off its water of crystallization on heating, and appears then as a white powder.  $\text{CuSO}_4$  is an emetic, principally used in phosphorus poisoning.

### What compound results when a solution of $\text{CuSO}_4$ is treated with $\text{NH}_3\text{OH}$ ?

A greenish-white precipitate is at first thrown down, which dissolves in an excess of the  $\text{NH}_3\text{OH}$  with a deep-blue color. This solution is known as the solution of ammonio-sulphate of copper, and a dry salt of that name is also officinal.

### What is copper nitrate?

Cupric nitrate  $\text{Cu}(\text{NO}_3)_2$ ; a crystalline salt, of dark-blue color, readily soluble in alcohol and water, and decomposed by heat into cupric oxide.

### Describe the compounds of copper with arsenic.

Copper arsenite  $\text{Cu}(\text{AsO}_3)_2$ , also called Scheele's green, is a bright-green powder, precipitated by treating copper solutions

with sodium or potassium arsenite. Schweinfurth or Paris green is an insoluble green crystalline powder, representing a mixture of acetate and arsenite of copper; both of these compounds are extremely poisonous, and the latter especially is used extensively for destroying insects on plants (potato bugs, etc.).

#### **Which is the principal carbonate of copper?**

The greenish-blue precipitate resulting when a solution of copper is treated with an alkaline carbonate; it is a basic carbonate of copper,  $\text{CuCO}_3\text{Cu(OH)}_2$ , also occurring in nature as malachite of a beautiful green color.

#### **What are the two acetates of copper?**

Cupric acetate or diacetate  $\text{Cu}(\text{C}_2\text{H}_3\text{O}_2)_2 + \text{Aq}$ ; large bluish-green crystals, and acetate of copper, cupri subacetas U. S., also called verdigris or aerugo, consisting of a mixture of three different basic acetates of copper, which occur in masses of pale-green or bluish color.

#### **What are the poisonous properties of copper?**

Pure copper is non-poisonous, but the commercial variety is rarely free from arsenic. Pure copper should not stain if boiled in HCl; copper vessels are often soldered with Pb and Sn, and these may prove poisonous. Food decaying in copper vessels often generates poisonous ptomaines. Copper is probably dissolved by food from all copper vessels, but this is so little that it does no harm, but if the vessels corrode, and the food takes up the compounds, poisonous symptoms may arise.

#### **What are the symptoms of poisoning by copper compounds?**

Vomiting and metallic taste of vomit; color, resembling that of bilious vomit, greenish; turning blue on addition of  $\text{HN}_3\text{OH}$ ; purging, tenesmus, colic pains, suppression of urine, and jaundice.

#### **What are the antidotes for acute copper poisoning?**

Iron by hydrogen, eggs, and demulcents.

#### **Describe the symptoms of chronic copper poisoning.**

These are frequently met with in malachite and copper

workers ; they exhibit a green line on the gums, lassitude, debility, tenesmus, and diarrhoea.

### Which articles of food may give rise to copper poisoning ?

Pickles, peas, and string-beans are sometimes colored with copper salts. Dentist's gold mixed with it may cause it, also spoiled flour corrected with Cu compounds, and jellies, sweet-meats, preserves, and fats left standing in copper vessels.

### How may copper compounds be recognized ?

Metallic iron, such as needles or knives, dipped into articles containing copper compounds, become covered with metallic copper ; H<sub>2</sub>S gives with Cu solutions black precipitate, also ammonium sulphhydrate, NH<sub>4</sub>OH in excess strikes a deep blue color, and potassium ferrocyanide a brown precipitate.

## Mercury.

### What are mercury and its properties ?

A bright metallic liquid Hg, a. w. 200, sp. gr. 13.6 ; volatile at all temperatures ; boils at 360° C. ; forms alloys with almost all metals ; remains unaltered in the air, but oxidizes at or near its boiling-point.

### What two classes of compounds does Hg form ?

Like copper it forms "ous" and "ic" compounds, being monoatomic in the "ic" and diatomic in the "ous" compounds, the molecules of the latter however seem to be regarded as double for-

mulas. Thus : Hg = O mercuric oxide,  $\begin{array}{c} \text{Hg} \\ | \\ \text{O} \end{array}$  mercurous oxide.

### Is Hg as metal poisonous, and to what do its galenical preparations owe their activity ?

In its metallic state it may be said to be non-poisonous, immense quantities having been ingested without disadvantage, and its preparations are more active on account of the mercurous oxide being present in them.

### Which are the officinal preparations of metallic mercury ?

Hydrarg. cum creta 38 per cent. ; massa hydrarg., blue mass, 33 per cent. ; unguent. hydrarg., blue ointment, 45 per cent.

**What is the difference in action of the "ous" and "ic" compounds of Hg.?**

The "ous" compounds are mild in action, and the "ic" compounds are violent and poisonous.

**Which are the two oxides of mercury?**

The mercurous or black oxide,  $Hg_2O$ , and the mercuric or red, also binoxide,  $HgO$ .

**What are the properties of mercurous oxide, and how formed?**

It is a brownish-black powder, gradually changing to  $HgO$  and  $Hg$ . It forms when a mercurous nitrate or chloride is treated with KOH or NaOH. It also forms when mercurous chloride (calomel) is treated with lime-water,  $Ca(OH)_2$ , and then forms the lotio nigra.

**Which are the two kinds of mercuric oxide, and how formed?**

$HgO$  occurs either in a crystalline or amorphous state ; the former being the so-called red precipitate or hydrargyri oxidum rubrum ; the latter the yellow oxide, also called hydrargyri oxidum flavum ; they are chemically identical, the red oxide being obtained by calcination of the mercuric nitrate ; the latter by precipitating the mercuric chloride with KOH or NaOH, or also with  $Ca(OH)_2$ , when it forms the lotio flava.

**Which are the two chlorides of mercury?**

Mercurous chloride or mild chloride of mercury, also calomel,  $Hg_2Cl_2$ , and mercuric chloride, or corrosive sublimate  $HgCl_2$ .

**What are the properties of mercurous chloride?**

Calomel, as ordinarily met with, is a white amorphous powder, which sublimes without fusing, insoluble in water and alcohol ; it is partly decomposed by the action of light into  $HgCl_2$  and  $Hg$  ; alkaline hydrates and carbonates decompose it into mercurous oxide ; with  $NH_4OH$  it gives a black precipitate ; it is not poisonous when pure and exhibited in ordinary doses, and may be given even in large doses with impunity ; together with HCl or gastric juice or nitro-hydrochloric acid it may be converted into  $HgCl_2$ .

**Give some of the reactions illustrating the incompatibilities of calomel.**

$\text{Hg}_2\text{Cl}_2$  with the hydrates or carbonates of K or Na react as follows :—

**How can the varying effects of calomel be explained ?**

By the different reactions of the substances it meets with in the course of digestion.

**What are the properties of mercuric chloride ?**

Corrosive sublimate is a crystalline compound, occurring in rectangular octahedra, crystallizing from water in fine rhombic prisms ; soluble in 15 parts water at ordinary temperature, sp. gr. 5.4, fuses at 288° C., and boils at 300° C. Alcohol dissolves about 30 per cent. of its weight, and ether 35 per cent. at ordinary temperature. It gives a white precipitate with  $\text{NH}_4\text{OH}$  ; with albumen it forms a white precipitate, soluble in an excess of albumen and alkaline chlorides ; it proves in this manner a corrosive poison, and is used principally as an antiseptic, which property it exhibits even in solutions of 1 to 40,000.

**What is the precipitate of  $\text{NH}_4\text{OH}$  with  $\text{HgCl}_2$  ?**

White precipitate or ammoniated mercury, also mercur-ammonium chloride,  $\text{NH}_4\text{HgCl}$ , used in the unguentum hydrargyri ammoniatum containing 10 per cent. of the  $\text{NH}_4\text{HgCl}$ .

**Which are the two iodides of mercury ?**

Mercurous iodide, also green or protoiodide of mercury  $\text{Hg}_2\text{I}_2$ , a greenish-yellow amorphous powder insoluble in water and alcohol, and mercuric iodide or biniodide, also red iodide of mercury,  $\text{HgI}_2$ , a bright red precipitate resulting when a mercuric salt is treated, without excess, by potassium iodide ; it dissolves readily in a solution of KI forming iodohydrargyrate of potassium ; this is used in the mixed treatment of syphilis, also as an antiseptic and as a local irritant.

**What is cyanide of mercury?**

Hydrargyri cyanidum U. S.,  $\text{Hg}(\text{CN})_2$ , a crystalline compound, soluble in water and alcohol and very poisonous.

**Which are the sulphides of mercury?**

Mercurous sulphide  $\text{Hg}_2\text{S}$  formed by the action of  $\text{H}_2\text{S}$  on mercurous compounds, and mercuric sulphide occurring in nature as cinnabar or vermillion  $\text{HgS}$ . It is also obtained by heating the black sulphide precipitated from mercuric salts by  $\text{H}_2\text{S}$ .

**Describe the two sulphates of mercury.**

Mercurous sulphate  $\text{Hg}_2\text{SO}_4$ , a crystalline precipitate used in the manufacture of calomel, and mercuric sulphate  $\text{HgSO}_4$ , a white crystalline mass used in the manufacture of corrosive sublimate ; subsulphate of mercury or turpeth mineral, a yellow insoluble basic salt ;  $\text{HgSO}_4 \cdot 2\text{HgO}$ , used as an emetic in group.

**Which are the principal nitrates of mercury?**

Mercurous nitrate,  $\text{Hg}_2(\text{NO}_3)_2$ , a crystalline compound formed by the action of  $\text{HNO}_3$  with  $\text{Hg}$  in excess ; and mercuric nitrate,  $\text{Hg}(\text{NO}_3)_2$ , formed by the action of  $\text{HNO}_3$  in excess upon  $\text{Hg}$  ; the solution of this latter is contained in the liquor hydrargyri nitratis or acid nitrate of mercury, and also in the unguentum hydrargyri nitratis or citrine ointment.

**Give the toxic doses, medical use, and poisonous properties of  $\text{HgCl}_2$ .**

The minimum fatal dose is about 3 grains, but recovery has taken place even after 80 grains ; it may prove fatal in from a half hour to two weeks. It is largely used as an antiseptic, alterative, and parasiticide, also locally to remove freckles, etc. : in poisonous doses it acts as a corrosive, causing great pain in throat, bloody stools, slowing of pulse, tympani, bloody and mucous vomit, great thirst, suppression of urine, and collapse.

**What is the antidote for acute poisoning by  $\text{HgCl}_2$ ?**

Eggs (1 egg can neutralize 4 grains), flour paste, mixture of iron filings and gold dust by galvanic action.

**How can chronic poisoning by Hg be produced, and what are the symptoms of it?**

By the vapors of Hg in looking-glass factories, by long continued medication with mercury compounds ; producing salivation, tremor, debility, anemia and fetid breath, reddened and inflamed gums and ulceration thereof.

**How can the ptyalism of Hg be distinguished from that of other poisons?**

It gives rise to redness and inflamed gums which the others do not, and, besides, the Hg can be demonstrated in the saliva.

**What is the treatment for chronic mercurialism ?**

Potassium iodide cautiously administered, also tonics, liberal diet, etc.

**What are the different analytical reactions between mercurous and mercuric chlorides ?**

Mercurous gives a black precipitate with  $H_2S$ , turns black with  $Ca(OH)_2$  forming  $Hg_2O$ , KOH turns it black, also  $NH_4OH$  ; with KI greenish-yellow precipitate of  $Hg_2I_2$ . Mercuric chloride gives with  $H_2S$ , slowly introduced, a whitish precipitate at first, turning dark and reddish-brown when heated ; with  $Ca(OH)_2$  a yellow precipitate ; with KOH a yellow precipitate ; with  $NH_4OH$  a white precipitate ; with KI a yellowish-red precipitate, soluble in excess of KI.

**Which are the parts to be tested in suspected Hg poisoning, and how are they to be treated ?**

The saliva and urine are to be tested by Reinsch's test, the copper slips of which, on heating, deposit microscopical globules of Hg on reduction tube. Contents of stomach and vomit should be boiled with HCl, the result mixed with alcohol and the evaporated residue to be treated with ether, the residue of which is then tested by Reinsch's test, and the resulting globules of mercury in the reduction tube heated with a small crystal of iodine when bright red  $HgI_2$  will form.

## Silver.

**What is silver and its properties ?**

A white brilliant metal, Ag, a. w. 10, sp. gr. 10.5. It is soft and ductile, fuses at 954° C., it does not combine with O directly but with the halogens ; exposed to air containing H<sub>2</sub>S, it turns black ; it dissolves in HNO<sub>3</sub> and H<sub>2</sub>SO<sub>4</sub>, to form salts ; it forms alloys with many metals, notably copper, which is of great hardness.

**How many oxides does silver form, and which is the principal one ?**

It forms three oxides of which the monoxide Ag<sub>2</sub>O is the principal one. It is prepared by precipitating silver nitrate solutions with KOH or NaOH, as a dark brown amorphous powder soluble in NH<sub>4</sub>OH, with which it forms a highly explosive compound—fulminating silver.

**What is silver chloride ?**

AgCl, a white curdy precipitate forming when a chloride or hydrochloric acid is added to a silver solution ; exposed to light it turns dark and is readily soluble in NH<sub>4</sub>OH.

**What is the principal salt of silver in use in medicine ?**

Silver nitrate, AgNO<sub>3</sub>, crystallizing in colorless right rhombic plates, soluble in equal parts of water ; it turns black when contaminated with organic matter, fuses readily, and can be cast in moulds, the cylinders or sticks resulting are termed lunar caustic, and are used as an application to ulcers and wounds.

**What is the precipitate resulting from the action of H<sub>2</sub>S on solutions of silver ?**

Ag<sub>2</sub>S, a black amorphous powder, insoluble in NH<sub>4</sub>OH.

**What is the poisonous action of AgNO<sub>3</sub> and antidote ?**

When swallowed it acts principally as a corrosive poison ; when compounds of silver are taken internally for some time blue indelible coloration of the skin is apt to take place. When poisonous doses of AgNO<sub>3</sub> are taken sodium chloride and raw eggs should be freely and promptly administered.

**How are compounds of silver recognized?**

HCl or soluble chlorides give with their solutions a white curdy precipitate insoluble in  $\text{HNO}_3$ , soluble in  $\text{NH}_4\text{OH}$ : KOH and NaOH give brownish precipitates insoluble in excess, soluble in  $\text{NH}_4\text{OH}$ . Ammonium hydrate, brownish precipitate soluble in excess. Hydrogen sulphide or  $\text{NH}_4\text{HS}$  gives black precipitates.

## Aluminium Group.

**Of which metals does this group consist?**

Aluminium, indium, gallium.

**What are the characteristics of the metals of this group?**

They are trivalents, form oxides which are weak bases, and their sulphates unite with those of the alkali metals to form double salts known as alums.

## Aluminium.

**What is aluminium?**

A silver-white metal, Al, a. w. 27, very light, sp. gr. 2.58, very ductile; it does not tarnish in the air; is not acted on by  $\text{HNO}_3$  and by  $\text{H}_2\text{SO}_4$  only on boiling, but is readily soluble in HCl, and in KOH and NaOH giving off H; it is used largely as an alloy with copper, termed aluminium bronze.

**Where and how does aluminium occur in nature?**

Its compounds are widely distributed in nature, the oxide crystallizing as ruby, sapphire, corundum, and as emery. Most commonly it is found as silicate in clay, feldspar, mud, and cryolite.

**What is the normal hydrate, and what the oxide of aluminium?**

The normal hydrate  $\text{Al}(\text{OH})_3$  is the amorphous gelatinous precipitate resulting when the solution of an aluminium salt is precipitated with ammonium hydrate or carbonate. By calcining this, aluminium oxide, alumina,  $\text{Al}_2\text{O}_3$ , is obtained; this is a white amorphous, odorless, tasteless powder, only slightly acted on by acids and alkalies.

**What are alums ?**

The double sulphates of aluminium and an alkali metal +12 Aq.

**What other compounds besides these are termed alums ?**

The double sulphates of chromium, iron, or manganese, and an alkali metal +12Aq.

**Which is the alum of the Pharmacopœia ?**

Potassium alum  $\text{AlK}(\text{SO}_4)_2 + 12\text{Aq}$ , crystallizing from water in large transparent octahedra, soluble in 8 parts of water, with acid reaction and sweetish styptic taste ; it loses its water of crystallization on calcining and is then called burnt alum.

**What alum was formerly in use, and officinal ?**

Ammonium alum  $\text{AlNH}_4(\text{SO}_4)_2 + 12\text{Aq}$ .

**Name some of the other so-called alums and give their formulæs.**

Potassium iron alum  $\text{FeK}(\text{SO}_4)_2 + 12\text{Aq}$ .

Ammonio chromium alum  $\text{CrNH}_4(\text{SO}_4)_2 + 12\text{Aq}$ .

Sodium manganese alum  $\text{MnNa}(\text{SO}_4)_2 + 12\text{Aq}$ .

**How may the compounds of aluminium be recognized ?**

White gelatinous precipitate with KOH or NaOH, soluble in excess ; NH<sub>4</sub> also causes a similar precipitate but it is not soluble in excess of reagent ; alkaline carbonates precipitate the hydrate with escape of CO<sub>2</sub>.

## Iron Group.

**Of which metals does this group consist ?**

Manganese, iron, cobalt, and nickel.

## Manganese.

**What are the three series of compounds formed by manganese, and what is its valences in them ?**

Manganous compounds in which it is a divalent ; manganic compounds in which it is tetravalent ; manganic acid derivatives in which it is hexavalent.

**Which is the principal oxide of manganese?**

Manganese dioxide or peroxide, also termed black oxide of manganese  $\text{MnO}_2$ , found in crystalline black masses; it is decomposed by hot  $\text{HCl}$  liberating  $\text{Cl}_2$ , and by  $\text{H}_2\text{SO}_4$  liberating  $\text{O}_2$ , forming manganous sulphate, a rose-colored crystalline salt  $\text{MnSO}_4$ .

**What is potassium permanganate?**

A dark-red crystalline compound  $\text{KMnO}_4$ , soluble in 12 parts of water, with a beautiful, deep-purple color, readily decomposed by organic matter, to which it gives off oxygen, thereby destroying it, rendering it a powerful disinfectant.

**When manganese compounds are treated with ammonium sulphide what results?**

A flesh-colored precipitate of manganous sulphide  $\text{MnS}$ .

## Iron.

**What is iron?**

Iron, ferrum,  $\text{Fe}$ , a. w. 56, is, when pure, a metal of a grayish-white color, sp. gr. 7.78; in moist air it is gradually covered with iron rust, ferrie hydrate; by heating in the air it is coated with ferrous-ferric oxide  $\text{Fe}_2\text{O}_4$ ; at red heat it decomposes water, liberating  $\text{H}_2$ ; it unites with the halogens and also sulphur, and dissolves in  $\text{HCl}$  and  $\text{H}_2\text{SO}_4$  to form ferrous compounds while liberating  $\text{H}_2$ ; it forms two classes of compounds, the ferrous and ferric; in the former it is divalent and monatomic, and diatomic and tetravalent in the latter; while still a higher oxide corresponds to the manganic acid derivatives and its hexavalent.

**What different varieties of iron are there?**

Three different varieties, owing to the amount of carbon contained in it. Thus cast-iron, containing 3 to 6 per cent. C., is very hard and brittle; steel 0.8 to 1.8 per cent. C., and wrought-iron, which has only about 0.2 to 0.6 per cent. C., is quite ductile.

**What form of metallic iron is officinal, and how is it prepared?**

The ferrum reductum, or iron by hydrogen, also Quevenne's

iron ; it is prepared by passing a current of hydrogen over ferric oxide at red heat, when the  $\text{Fe}_2\text{O}_3$  is reduced to Fe.

### What is ferrous and what ferric hydrate, and how formed ?

$\text{Fe(OH)}_2$  is formed when a ferrous compound is treated with an alkaline hydrate,  $\text{FeSO}_4 + 2\text{NH}_4\text{OH} = \text{Fe(OH)}_2 + (\text{NH}_4)_2\text{SO}_4$ ; it is a whitish-green precipitate, rapidly changing to muddy-green and reddish-brown. Ferric hydrate  $\text{Fe}_2(\text{OH})_6$  results when a ferric compound is treated with an alkaline hydrate,  $\text{Fe}_2\text{Cl}_6 + 6\text{NH}_4\text{OH} = \text{Fe}_2(\text{OH})_6 + 6\text{NH}_4\text{Cl}$ ; a reddish-brown precipitate, which gradually changes to form oxyhydrate  $\text{Fe}_2\text{O}(\text{OH})_4$ .

By what formulas can the monatomic and diatomic character of respectively ferrous hydrate and ferric hydrate be illustrated ?

Give some of the synonyms of ferric hydrate, and its principal use in medicine.

Ferri oxidum hydratum U. S., hydrated oxide of iron, also hydrated sesquioxide of iron, principally used as an antidote for poisoning by arsenic, also in the manufacture of dialyzed iron.

How is ferric hydrate prepared for use as an antidote ?

Precipitate ferric chloride or ferric sulphate solution with  $\text{NH}_4\text{OH}$  ; separate the moist precipitate on a strainer, wash well with water until all ammonia odor has disappeared, and then administer in tablespoonfuls. As it changes to the inert oxyhydrate on standing, it should always be prepared fresh as needed.

By what process is this antidote for arsenic still better and more promptly made ?

By precipitating the ferric chloride or sulphate solutions with magnesia :  $\text{Fe}_2(\text{SO}_4)_3 + 3\text{MgO} + 3\text{H}_2\text{O} = 3\text{MgSO}_4 + \text{Fe}_2(\text{OH})_6$  ; this

needs no straining or washing, and an excess of magnesia will prove rather of advantage than otherwise.

**How may this be kept on hand for use in emergencies?**

The ferric solution and the magnesia in different bottles, as follows:—

R. Liq. ferri tersulphatis, fʒij;  
Aquæ, fʒvi.

M. S. A.

R. Magnesiæ, gr. cl;  
Aquæ, fʒvij.

M. S. B.

Keep *A* and *B* separate until needed, when they are simply mixed to be ready for use.

**Illustrate the reaction by which  $\text{Fe}_2(\text{OH})_6$  acts as an antidote for arsenic.**

$2(\text{Fe}_2(\text{OH})_6) + \text{As}_2\text{O}_3 = \text{Fe}_2\text{AsO}_4 + 5\text{H}_2\text{O} + \text{Fe}(\text{OH})_3$ ;  
*i. e.*, the ferric hydrate changes the arsenic into the inert ferrous arsenate.

**What is dialyzed iron?**

Ferric hydrate dissolved in a solution of ferric chloride to saturation, and deprived of free acid and crystalloids by dialysis.

**What is the value of dialyzed iron medicinally and as an antidote for arsenic?**

It is not now considered as of much value, if of any, therapeutically, but is claimed as a good antidote for arsenic.

**What is dialysis?**

The process of separating crystalloids and colloids by osmosis through a colloid septum, such as animal membranes or parchment paper.

**Define the meaning of diffusate, dialysate, crystalloids, and colloids.**

A diffusate is the substance capable of passing through the dialyzing membrane; a dialysate that which in the same process does not pass through; crystalloids are bodies capable of assum-

ing regular or crystalline form, and colloids such as assume only irregular or globular form.

**Which are the principal oxides of iron?**

Ferrous oxide  $\text{FeO}$ ; Ferric oxide  $\text{Fe}_2\text{O}_3$ , the colgothar or caput mortuum, residue in the manufacture of Nordhausen sulphuric acid from ferrous sulphate; ferrous-ferric oxide or magnetic oxide of iron  $\text{Fe}_3\text{O}_4$ .

**Describe the two chlorides of iron.**

Ferrous chloride  $\text{FeCl}_2$ , a green deliquescent crystalline compound, forming by the action of  $\text{HCl}$  on metallic iron; ferric chloride, also termed sesquichloride or perchloride of iron  $\text{Fe}_2\text{Cl}_6 + 6\text{Aq}$ , remaining on evaporation of the solution in yellow crystalline masses, soluble in water, alcohol, and ether.

**What is the officinal solution and tincture of ferric chloride?**

Liquor ferri chloridi U. S. is a solution containing 31.8 per cent.  $\text{Fe}_2\text{Cl}_6$ ; prepared by dissolving Fe in an excess of  $\text{HCl}$ , adding  $\text{HNO}_3$  while boiling, when  $\text{Fe}_2\text{Cl}_6$  is formed; 35 parts of this with 65 parts of alcohol make the tinctura ferri chloridi U. S.

**What is ferrous bromide, and what is its officinal preparation?**

$\text{FeBr}_2$ , a yellowish-green crystalline compound, entering the syrpus ferri bromidi U. S. which contains 10 per cent. of it.

**What is ferrous iodide, and its officinal preparations?**

$\text{FeI}_2$ , prepared by the action of iodine on iron in excess. It enters the syrpus ferri iodidi U. S. to the extent of 10 per cent.; pilulae ferri iodidi containing 1 grain each of  $\text{FeI}_2$ , with an excess of reduced iron.

**What is ferrous sulphide, how prepared, and for what used?**

A brownish-black mass, ferri sulphuretum U. S.;  $\text{FeS}$  is formed by fusing sulphur and iron filings in a red-hot crucible; it is used to prepare hydrogen sulphide, *q. v.*

**Describe the ferri sulphas U. S.**

It is ferrous sulphate, also termed copperas, or green vitriol  $\text{FeSO}_4 + 7\text{Aq}$ ; a green crystalline salt, somewhat efflorescent;

loses its water of crystallization on heating, and then forms a white powder, known as dried sulphate of iron, or ferri sulphas exsiccatus.

### Which are the principal ferric sulphates?

The normal sulphate  $\text{Fe}_2(\text{SO}_4)_3$ , 28.7 per cent. in the liquor ferri tersulphatis U. S., and the basic ferric sulphate  $\text{Fe}_2\text{O}(\text{SO}_4)_2$ , 43.7 per cent. of which is contained in the liquor ferri subsulphatis U. S., Monsell's solution. Both of the officinal solutions are reddish-brown.

### What is liquor ferri nitratis U. S.?

A solution containing about 6 per cent. of the ferric nitrate  $\text{Fe}_2(\text{NO}_3)_3$ .

### What is ferrous phosphate, and what the ferri phosphas U. S.?

Ferrous phosphate  $\text{Fe}_2(\text{PO}_4)_3$ , resulting when ferrous sulphate is precipitated with di-sodium phosphate; it is a powder, white at first, but rapidly turning blue. The ferri phosphas U. S. is a sodio-ferric-citro-phosphate, in thin bright green scales.

### Which carbonate of iron is used in medicine, and in what form?

The ferrous carbonate  $\text{FeCO}_3$ , resulting from the decomposition of ferrous sulphate with an alkaline carbonate; it is a whitish-green precipitate turning brown owing to the formation of ferric hydrate, which is prevented by the addition of sugar. The officinal preparations are ferri carbonas saccharatus, a grayish-green powder, massa ferri carbonatis or Valett's mass, containing about 42 per cent.  $\text{FeCO}_3$ .

### What is Prussian blue?

Ferric ferrocyanide; ferri ferrocyanidum U. S.,  $(\text{Fe}_2)_2(\text{FeC}_6\text{N}_6)_3 + 18\text{Aq}$ , a dark blue precipitate resulting from potassium ferrocyanide and a ferric salt.

### How can the compounds of iron be recognized?

Ferrous of white or greenish color; alkaline hydrates, greenish-white precipitates; ammonium sulphhydrate, black precipitate soluble in acids; potassium ferrocyanide, greenish-white precipitate; potassium ferricyanide, blue precipitate (Turnbull's blue).

Ferric are of yellow or brown color ; alkaline hydrates, heavy brown precipitate ; ammonium sulphhydrate, black precipitate (same as in faeces) ; potassium ferrocyanide, dark blue precipitate (Prussian blue) ; potassium sulphocyanide, dark red color ; tannin, blue-black precipitate (the ferric salts are for this reason incompatible with vegetable astringents).

### Nickel.

**What is nickel ?**

A silvery-white metal Ni, a. w. 58.6, of great lustre and very tenacious, sp. gr. 9.1, it does not tarnish in the air ; it is used largely in alloys, and as a coating for steel and iron instruments to prevent them from rusting : it takes on a high polish when so used.

**Which compound of nickel is used sometimes in medicine ?**

The nickelous bromide,  $\text{NiBr}_2 + 3\text{Aq}$ , which is often made into a syrup of beautiful dark green color.

### Chromium Group.

**Which is the member of this group of interest in medicine ?**

Chromium, Cr, a. w. 52.4, forming two series of compound chromous, and chromic, also chromic acid derivatives ; it forms a double sulphate with the alkali metals, termed chromium alum, *q. v.*

**What are the principal oxides of chromium ?**

Chromic oxide  $\text{Cr}_2\text{O}_3$ , a green amorphous powder, and chromium trioxide  $\text{CrO}_3$ , or chromic acid anhydride.

**What are the properties of chromic acid anhydride ?**

Chromium trioxide, also termed erroneously chromic acid, crystallizes in long red rhombic needles or prisms, is very deliquescent and soluble in water : it is a powerful oxidizing agent, destroying organic matter.

**Which is the potassium salt corresponding to chromic acid ?**

Potassium chromate, also termed neutral or yellow potassium chromate  $\text{K}_2\text{CrO}_4$ , used as an indicator in the determination of chlorides, *q. v.*

**What is potassium dichromate?**

Bichromate of potassium or acid potassium chromate, also termed red potassium chromate,  $K_2Cr_2O_7$ , corresponding to a non-isolated acid of the formula  $H_2Cr_2O_7$ , analogous in its composition to fuming sulphuric acid ( $H_2S_2O_7$ ), largely employed in battery fluid, *q. v.*

**What is the action of the chromates on the economy?**

They are irritant and corrosive poisons;  $K_2CrO_4$  is sometimes used in the treatment of syphilis. The chromates act also as local irritants, producing in workmen engaged with them chronic ulcers and ozena resembling those of arsenic; they often aggravate syphilitic sores.

**What is the treatment for, and the analytical characters of the chromates?**

Removal of cause, potassium iodide; they give no precipitate with  $H_2S$  but a green precipitate with  $NH_4HS$ ; with lead salts they produce yellow lead chromate.

**Uranium.**

Symb. U, a. w. 240.

**What are the principal salts of uranium used in medicine?**

Uranium nitrate or uranyl nitrate,  $UO_2(NO_3)_2$ , large greenish-yellow prisms used sometimes in the treatment of diabetes mellitus. Uranium acetate  $UrO_2(C_2H_3O_2)_2$  used for the titration of phosphoric acid.

**Tin Group.****What is the most important metal of this group?**

Tin, stannum, Sn, a. w. 117.8, a silvery-white metal, sp. gr. 7.3, of crystalline structure, soft and ductile, fusing at 228° C., and distilling at white heat. It does not oxidize on exposure, forms a number of useful and interesting alloys, and two series of compounds, stannous and stannic; it is a dyad in the former and a tetrad in the latter.

**Which are the oxides of Sn ?**

Stannous oxide,  $\text{SnO}$ , a brownish-black powder which burns, when heated in the air, to stannic oxide ; putty powder,  $\text{SnO}_2$ , a white amorphous powder, insoluble and infusible, but yielding stannates when fused with the hydrates of potassium or sodium.

**What is stannous chloride ?**

A crystalline compound,  $\text{SnCl}_2 + \text{Aq}$ , resulting from the action of  $\text{HCl}$  on metallic tin. It is used as mordant in dyeing, under the name of tin salt, and as a reducing agent.

**What is stannic chloride ?**

A colorless liquid,  $\text{SnCl}_4$ , fuming in the air, sp. gr. 2.27, boiling at  $114^\circ \text{ C}$ .

**What precipitates result respectively from stannous and stannic compounds with  $\text{H}_2\text{S}$  ?**

Stannous give brown stannous sulphide,  $\text{SnS}$ . Stannic give yellow stannic sulphide,  $\text{SnS}_2$ .

**Is tin poisonous and how do its soluble compounds act ? Antidotes ?**

Metallic tin is non-poisonous but its soluble compounds are irritant poisons. Antidotes : ammonium carbonate, milk, and eggs.

**How may stannous and stannic compounds be recognized ?**

Stannous give brown precipitate with  $\text{H}_2\text{S}$ ; with mercuric chloride gray precipitate of  $\text{Hg}$ ; with gold chloride a purple precipitate. Stannic give yellow precipitate with  $\text{H}_2\text{S}$ ; with  $\text{KOH}$  or  $\text{NaOH}$  white precipitate soluble in excess, also with ammonium hydrate or carbonate, slightly soluble in excess.

## **Bismuth Group.**

**What is the principal member of this group, and what group should it really belong to ?**

Bismuth. It should be classed with the nitrogen group, but it does not form a hydrogen compound like the other members.

**What is bismuth ?**

A reddish-white metal, Bi, a. w. 207, sp. gr. 9.9, crystalline, fusing at 267° C., and distilling at white heat. Like members of the nitrogen group it forms two oxides  $\text{Bi}_2\text{O}_3$  and  $\text{Bi}_2\text{O}_5$ , and is therefore triad and pentad; it is readily acted on by  $\text{HNO}_3$ , and its soluble salts are converted by water into insoluble basic salts.

**Which are its principal halogen compounds ?**

Bismuth chloride,  $\text{BiCl}_3$ , forming with water a white crystalline precipitate of bismuth oxychloride,  $\text{BiOCl}$ ; bismuth bromide,  $\text{BiBr}_3$ , and  $\text{BiI}_3$  are analogous compounds; bismuth subiodide,  $\text{BiOI}$ , is a red amorphous powder used as a surgical dressing.

**What results if soluble compounds or salts of Bi are diluted with water ?**

Oxycompounds or oxysalts result containing the group  $(\text{BiO})^1$  which is by some regarded as a radical and termed bismuthyl.

**Which is the principal oxide of bismuth ?**

The trioxide,  $\text{Bi}_2\text{O}_3$ , formed by the oxidation of metallic bismuth by burning it in air.

**What results if an oxysalt of bismuth is treated with KOH or NaOH ?**

A metahydrate,  $\text{BiO(OH)}$ , is formed.

**What changes does  $\text{BiO(OH)}$  undergo on boiling ?**

It changes to bismuth trioxide,  $\text{Bi}_2\text{O}_3$ .

**Which test depends on this ?**

The alkaline bismuth or Boettger's test for glucose; it depends on forming first a bismuth metahydrate,  $\text{BiONO}_3 + \text{KOH} = \text{BiO(OH)} + \text{KNO}_3$ , the  $\text{BiO(OH)}$  becoming  $\text{Bi}_2\text{O}_3$  in turn, which is deoxidized by glucose and metallic bismuth results.

**How is Boettger's test for glucose performed ?**

Put in a test tube equal volumes of suspected urine and KOH with a pinch of bismuth subnitrate; on boiling, if glucose is present, the white powder turns gray, brown, or black from reduction to metallic bismuth.

**Which are the fallacies of this test, and how detected ?**

Albumin and sulphur compounds in the urine may cause a black precipitate of bismuth sulphide,  $\text{Bi}_2\text{S}_3$ . To detect them make the test, using a little litharge instead of the bismuth salt ; if this blackens, the test is not available.

**Which are the two bismuth nitrates ?**

Bismuth nitrate,  $\text{Bi}(\text{NO}_3)_3$ , a crystalline salt formed by the action of  $\text{HNO}_3$  on bismuth. Bismuth subnitrate,  $\text{BiONO}_3$ , usually of varying and indefinite composition, is a white powder consisting of microscopical crystals formed by precipitating  $\text{Bi}(\text{NO}_3)_3$  with water.

**What is bismuth generally contaminated with ?**

With arsenic in greater or less proportion.

**What is bismuth subcarbonas U. S. ?**

A white precipitate,  $(\text{BiO})_2\text{CO}_3$ , forming when a soluble salt of bismuth is precipitated by an alkaline carbonate.

**How may bismuth compounds and salts be recognized ?**

Solutions give a white precipitate with alkaline hydrates insoluble in excess, turning yellow on boiling :  $\text{H}_2\text{S}$  and  $\text{NH}_4\text{HS}$  give black precipitates of  $\text{Bi}_2\text{S}_3$  ; largely diluted with water solutions give rise to precipitates of basic salts soluble in  $\text{HNO}_3$ .

## Platinum Group.

**Which are the most notable members of this group ?**

Gold and platinum.

### Gold.

**What is gold ?**

Gold, aurum, Au, a. w. 196, is a soft yellow metal, sp. gr. 19.32, very ductile, melts at  $1035^\circ \text{C}$ . to a greenish liquid : is not acted on by oxygen directly nor by the acids, excepting nitro-hydrochloric acid ; it forms various alloys harder than the pure metal.

**What are the chlorides of gold?**

The aurous chloride,  $\text{AuCl}_2$ ; and the auric chloride,  $\text{AuCl}_3$ , resulting on solution of gold in aqua regia. The auric chloride forms double salts with the alkaline chlorides, such as  $\text{AuCl}_3 \cdot \text{KCl}$ ,  $\text{AuCl}_3 \cdot \text{NaCl}$ ,  $\text{AuCl}_3 \cdot \text{NH}_4\text{Cl}$ ; some of these are used medicinally;  $\text{AuCl}_3$  is used as a precipitant for alkaloids and ptomaines.

**Platinum.****What is platinum?**

A metal, Pt, a. w. 194, of grayish-white color, sp. gr. 21.4, very tough, malleable, and ductile. It melts only at intense heat, and is insoluble in all acids excepting aqua regia; it forms platinous and platinic derivatives.

**Which is the principal compound of platinum?**

Platinic chloride,  $\text{PtCl}_4$ , obtained by dissolving platinum in aqua regia; it is reddish-brown and very deliquescent, forms double chlorides with  $\text{KCl}$  and  $\text{NH}_4\text{Cl}$ , which are crystalline and very insoluble in water; on this account  $\text{PtCl}_4$  is used as a reagent to detect potassium and ammonium compounds, and also as a precipitant for alkaloids and ptomaines.

## Hydrocarbons and Derivatives.

**Why was the chemistry of the carbon compounds formerly considered separately as organic chemistry?**

Because it was thought that organic force played a material part in their development, and that the living organism alone was capable of producing them.

**Is this so, and is organic chemistry based upon different principles from that of the so-called inorganic bodies?**

No, for many organic products have been synthetically built up, and the chemical laws applying to other elements also apply to carbon.

**Which compounds of carbon are the most numerous?**

The compounds of carbon with hydrogen, termed hydrocarbons, and their derivatives.

**What two classes may these be divided into?**

Into the fatty and aromatic, according to the characters of their derivatives.

**How else may they be subdivided?**

Into saturated or paraffins, and into unsaturated hydrocarbons.

**What are saturated hydrocarbons?**

Hydrocarbons in which the affinities of the tetravalent carbon are singly satisfied, and which cannot form compounds except by substitution.

**What are unsaturated hydrocarbons?**

Those resulting when saturated hydrocarbons lose some of their hydrogens and the affinities of these go to the carbon atoms of each other. They can form direct addition compounds with other atoms or radicals.

**How are hydrocarbons grouped?**

Into homologous series, *i. e.*, groups in which each member increases over the other by  $\text{CH}_2$ ; if grouped so that they increase by  $\text{H}_2$  the series are called isologous.

### How are homologous series characterized?

By algebraic formulas giving the relative proportion of the number of carbon atoms to those of hydrogen combined with them as follows:  $C_nH_{2n+2}$  in which  $n$  expresses the number of atoms of each; thus if 2 were to stand for  $n$ ,  $C_nH_{2n+2}$  would be  $C_2H_{2\times 2+2}=C_2H_6$ .

### What is the simplest saturated hydrocarbon, and its graphical formula?

### What is the carbon skeleton?

The graphical formula representing saturated hydrocarbons:

### How may saturated hydrocarbons also be regarded?

As hydrides of radicals, the latter having one free affinity with which they can combine with univalent atoms or radicals; thus  $CH_4=CH_3H$ ; the radicals ending in "yl," as per example, methyl  $CH_3$ .

### Which are the first six members of the methane series?

$C_nH_{2n+2}$	$C_nH_{2n+1}$
$CH_4$ Methane	radical Methyl $CH_3-$
$C_2H_6$ Ethane	" Ethyl $C_2H_5-$
$C_3H_8$ Propane or tritane	" Propyl $C_3H_7-$
$C_4H_{10}$ Butane or tetrane	" Butyl $C_4H_9-$
$C_5H_{12}$ Pentane	" Amyl $C_5H_{11}-$
$C_6H_{14}$ Hexane	" Hexyl $C_6H_{13}-$

### What is methane?

Marsh-gas, light, carburetted hydrogen or firedamp, is a light colorless, tasteless gas, sp. gr. 0.559, does not support combustion,

but burns with a blue flame ; mixed with air and ignited it explodes ; it generates from decaying organic matter in swamps, also in mines and from coal and petroleum deposits ; in mines it forms the firedamp ; it is the principal ingredient in natural gas ; it is also present in coal gas ; pure methane may be prepared by heating NaOH and sodium acetate.

### **How is fire-damp detected in mines ?**

By the use of a Davy's safety lamp, which consists of a lamp perfectly closed with wire gauze ; when the gas burns inside with blue flame fire-damp is present.

### **On what principle do they work ?**

The gauze cools off the flame, and by reducing its heat prevents its reaching the kindling point of the fire-damp.

### **What is ethane ?**

$\text{C}_2\text{H}_6$ , the second member of the methane group ; a colorless, odorless gas, which may be also considered as an ethyl hydride

### **How may ethane be prepared ?**

By the action of sodium on monochlormethane.

### **In what substance are many of the higher members of the methane series contained ?**

In petroleum, which is itself a complex body, composed of many other hydrocarbons of different boiling points and density.

### **Which are some of the well-known bodies isolated from petroleum ?**

Rhigolene, gasolin, benzin (petroleum ether), coal oil, lubricating oils, petroleum, and paraffin.

### **What is petrolatum ?**

Mixtures of paraffin and heavier petroleum oils, purified and of proper density ; they are known variously as vaseline, cosmoline, etc., used largely as ointment bases.

**What is paraffin ?**

A white solid hydrocarbon, used in the manufacture of candles, also for coating labels and stoppers to prevent them from the action of corrosive fluids.

**Substitution compounds of hydrocarbons, what are they ?**

Compounds formed by replacing one or more of the hydrogens of a saturated hydrocarbon by elements or radicals.

**Show the chlorine substitution in methane.****What are the substitution products of the halogens called ?**

Halogen substitution products, or haloid ethers.

**What are the products of substitution in methanes also called ?**

Methyl compounds, as they may be viewed as compounds of the radical methyl with the substituting body.

**What is brommethane or methyl bromide ?**

A clear mobile liquid,  $\text{CH}_3\text{Br}$ , made by the action of Br on methane, or better by HBr on methylic alcohol,  $\text{CH}_3\text{OHI}$ ; it has anæsthetic properties.

**Iodomethane, what is it ?**

Methyl iodide,  $\text{CH}_3\text{I}$ , made similar to  $\text{CH}_3\text{Br}$ , but with iodine instead of Br.

**What is dichlormethane ?**

Methyl dichloride,  $\text{CH}_3\text{Cl}_2$ ; a colorless heavy liquid, resembling chloroform, also anæsthetic.

**Trichlormethane, what is it ?**

Chloroform  $\text{CHCl}_3$ ; a heavy mobile liquid.

**What are all the chlorine substitution products of methane, and why of interest in medicine ?**

Because they are all anæsthetics.

**Describe the physical properties of chloroform.**

It is a heavy mobile fluid, of pleasant odor, non-inflammable, sp. gr. 1.497, and of a burning taste.

**Name the two varieties of chloroform in the market, which alone should be used for anaesthesia, and state the test for the latter.**

Chloroformum venale and chloroformum purificatum ; the latter only should be used for anaesthesia ; shaken with equal volumes of  $H_2SO_4$ , it should color it only slightly yellow.

**How and when only should chloroform be administered as an anaesthetic ?**

With access of atmospheric air and due care, and after ascertaining absence of heart lesions.

**What should be done if heart failure from chloroform ensues in anaesthesia ?**

Ammonia or whiskey, or both, should be injected ; nitrite of amyl for inhalation ; galvanism to cardiac region, and artificial respiration.

**How does chloroform act locally and how internally in toxic doses ; antidotes ?**

Locally, chloroform acts as a rubefacient, vesicant if confined, and slightly anaesthetic ; internally, it sets up inflammation of the stomach ; treated by oils, emetics, and stomach pump.

**What is the tri-iodomethane, and how made ?**

Iodoform,  $CHI_3$ , formed by the action of KOH or NaOH in water on alcohol with iodine ; it is used as a test for the presence of alcohol and will show  $\frac{1}{500}$  part of it.

**Show the physical and medicinal properties of iodoform.**

It is a crystalline solid of yellow color and saffron-like odor ; it contains 96.7 per cent. of iodine, possesses anaesthetic powers, especially locally on the anal sphincter ; it is poisonous in over doses.

**What is tri-brommethane ?**

Promoform,  $CHBr_3$ , a colorless liquid, resembling chloroform.

**What is chlorethane ?**

Ethyl chloride,  $C_2H_5Cl$ , an ethane in which one H is substituted by Cl.

**What is bromethane ?**

Ethyl bromide,  $C_2H_5Br$ , an ethane in which one H is substituted by Br : it is a colorless heavy liquid of ethereal odor, an anaesthetic of great value, but not less dangerous than chloroform.

**What is iodoethane ?**

Ethyl iodide,  $C_2H_5I$ , a heavy liquid of ethereal odor, has anaesthetic properties, used for inhalation, and apt to grow darker on keeping by the liberation of iodine.

**What is dichlorethane ?**

Dichlorethane is isomeric with ethylene chloride.

**Name the principal oxygen derivatives of the hydrocarbons.**

Alcohols, ethers, aldehydes, and acids.

**Alcohols.****What is an alcohol, and what different forms of alcohol are there ?**

Alcohols are hydrates of hydrocarbon radicals ; according to the saturating power of the radicals there are monatomic, diatomic, and triatomic alcohols.

**What is methylic alcohol ?**

Methyl hydrate,  $CH_3OH$ ; wood spirits, pyroxylic spirit or wood naphtha, derived by dry distillation of wood ; if mixed with 90 per cent. of ethylic alcohol it is known as methylated spirits, such as used in the arts, and is so contaminated in order to prevent its use for drinking purposes.

**What are the properties of methylic alcohol?**

It is a clear, colorless liquid if pure, boils at 66.7° C., burns and intoxicates, is poisonous when concentrated, and a solvent for fats, oils, resins, and is used for making varnishes, also to preserve specimens.

**What is ethylic alcohol, and how obtained?**

Ethyl hydrate,  $C_2H_5OH$ , spirit of wine, ordinary alcohol, obtained by distillation of fermented glucose or substances containing it.

**How does glucose split up by fermentation?**

It splits up into alcohol,  $C_2H_5OH$ , and carbon dioxide.

**Fermentation, what is it?**

Chemical action induced by ferment.

**How may ferment be subdivided?**

Into organized and soluble ferment.

**What are organized ferment?**

Minute bodies of organized existence capable of growth and reproduction; they can be separated by filtration.

**Which organized ferment induces alcoholic fermentation?**

The so-called brewers' yeast, termed torula or *saccharomyces cerevisiae*.

**Which are the unorganized or soluble ferment of the body?**

Ferment bodies incapable of growth and reproduction, and readily passing through filters; they are the salivary, gastric, and pancreatic digestive ferment.

**Explain the action of the salivary ferment.**

Ptyalin, the ferment contained in saliva, converts starch into glucose.

**What is the action of the gastric ferment?**

Pepsin, the gastric ferment, converts albumin into peptone, leucin, tyrosin, indol, etc.

**How does the pancreatic ferment act on the fats?**

Pancreatin splits up the neutral fats into fatty acids and glycerin.

**What is the first step in the process for the production of alcohol?**

The conversion of starch by malt diastase (analogous to ptyalin) into glucose.

**How can the complete conversion of starch into dextrin and glucose be proven?**

When the wort, on addition of iodine, no longer gives rise to a blue color.

**What is extract of malt, and what is its medicinal value?**

An extract produced by condensing wort made from malt. Its value depends on the amount of glucose and dextrin it contains as nutrients, and on the presence of diastase as a ferment to aid in the digestion of carbohydrates.

**Describe the second stage of the process for the manufacture of alcohol.**

This consists of the fermentation of the wort by means of brewers' yeast.

**Are other products besides alcohol and  $\text{CO}_2$  results of fermentation of wort?**

Yes; various others are caused by the presence and action of foreign ferments in the air; the vinegar ferment (*mycoderma aceti*) may also induce acetous fermentation of the alcohol, *i. e.*, produce vinegar (acetic acid)  $\text{C}_2\text{H}_6\text{O} + \text{O}_2 = \text{C}_2\text{H}_4\text{O}_2 + \text{H}_2\text{O}$ .

**What fermentation would putrid cheese induce?**

It would induce lactic fermentation, splitting up the glucose into lactic acid, of which it is a polymeric isomer.

**Is cane sugar subject to the same fermentative changes as glucose?**

No, it has to be changed into glucose first.

**What is butyric fermentation?**

The splitting up of lactic acid under the influence of butyric ferment into butyric acid, carbon dioxide, and hydrogen.

**Describe the properties of alcohol.**

It is a light, colorless liquid of characteristic odor and of burning taste, miscible in all proportions with water, the mixing being accompanied by elevation of temperature and contraction of volume. The alcohol of the U. S. P. has a sp. gr. 0.820, containing 94 per cent. of absolute alcohol by volume.

**What does alcohol usually contain when first distilled, and how deprived of it?**

It contains amylic alcohol (fusel oil), succinic acid, and glycerin, the former of which is removed by the absorptive power of charcoal.

**By what test, and how can the presence of alcohol be established?**

By Anstie's test, which consists of adding to the liquid to be tested a little potassium dichromate,  $\text{K}_2\text{Cr}_2\text{O}_7$ , and some sulphuric acid; on warming a beautiful emerald-green color will be developed if alcohol is present.

**On what chemical changes does this test depend?**

On the formation of chromic acid first, which, by the oxidation of the alcohol, is reduced to the emerald-green chromium oxide  $\text{Cr}_2\text{O}_3$ .

**To what is the deleterious effect of young and poor whiskey due?**

To the presence of fusel oil, amylic alcohol,  $\text{C}_3\text{H}_11\text{OH}$ , also called potato spirit, which in small quantities has a pleasant odor, but a suffocating one when strong. It rapidly produces intoxication, gastric disturbance, and headache.

**Which are the principal alcoholic beverages, and what amount of alcohol do they contain?**

Weiss beer 1 per cent., lager beer  $2\frac{1}{2}$  to  $3\frac{1}{2}$  per cent., ale and porter about 6 per cent; sweet wines contain undecomposed sugar; dry wines have all their sugar converted into alcohol; sparkling wines are fermented so as to retain the  $\text{CO}_2$  in solution. Vinum album and vinum rubrum contain 10-12 per cent.; vinum rubrum fortior contains about 20 per cent., cider about 6 per cent.; brandy, whiskey, gin, and rum about 40-50 per cent.

**Of what medicinal use are alcoholics?**

They are diffusible stimulants, especially for the cardiac action.

**How does alcohol act as a poison?**

In acute poisoning the nerve action is paralyzed until the progressive influence reaches the medulla, when coma ensues; in chronic poisoning it causes thickening of the connective tissue, and thus catarrhal conditions of the mucous membranes and atrophy of the glands and organs, liver, kidneys, brittle condition of the bloodvessels, tremor and dulness, ending in paraplegia.

**What is the treatment for alcoholic coma?**

Stomach pump, faradism over the diaphragm, flagellation with wet cloths, cold affusion, and artificial respiration.

### Ethers.

**What are ethers?**

Oxides of alcoholic radicals bearing the same relation to alcohols as oxides of bases to their hydrates.  $\text{CH}_3\text{OII}$  like  $\text{KOH}$ ,  $(\text{CH}_3)_2\text{O}$  like  $\text{K}_2\text{O}$ .

**Give reaction if methylic or ethylic alcohols are treated with potassium.**

The H of the OH of the alcohols is replaced, and the oxide of methyl or ethyl and potassium results.

If, in this resulting oxide, the K is displaced by methyl or ethyl iodide, what forms?

The methyl or ethyl takes the place of the K, and ether is formed.

What is then the chemical constitution of ether?

Two univalent alcoholic radicals united by a bivalent oxygen.

How do the alcoholic radicals behave chemically?

Like the metals.

How is ether produced on a large scale?

In two reactions.

1. Ethyl alcohol is acted on by  $\text{H}_2\text{SO}_4$ , the alcoholic radical takes the place of one H of  $\text{H}_2\text{SO}_4$ , forming ethyl-sulphuric acid.

2. The ethyl-sulphuric acid (sulphovinic acid) with another molecule of alcohol forms the oxide of two ethyl radicals and sulphuric acid is set free again.

Does ethyl-sulphuric acid act by catalysis, and what is catalysis?

It does not act by catalysis. Catalysis means the action by the presence of a body, and is really chemically an undefined term.

Is the term sulphuric ether for ether a correct one?

No; because it contains neither sulphuric acid nor sulphur.

What are the properties of ether?

It is a colorless, limpid, mobile liquid, of sharp burning taste and a characteristic ethereal odor, sp. gr. 0.723, boils at  $34.5^\circ\text{C}$ ., slightly soluble in water; it is highly inflammable, and when mixed with air it is explosive.

In regard to their use as anaesthetics, what is to be observed with ether and chloroform respectively?

Ether can be administered without access of air, but chloroform should always be administered with access of air ; ether is inflammable, both in substance and its vapors as well. Chloroform is not inflammable.

### What are mixed ethers ?

Ethers that have two different alcoholic radicals ; e.g., methyl-ethyl ether.

### What are compound ethers ?

Compound ethers, sometimes termed esters, are compounds containing one univalent alcoholic radical united by oxygen to a monobasic acid radical.

### What do these compounds correspond to ?

To the salts of inorganic bodies, the alcoholic radical representing the electropositive, the acid radical the electronegative, both united by oxygen.

### Give the reaction for the formation of acetic ether or ester.

Alcohol.    Acetic acid.    Acetic ether=ethyl acetate.

### In making acetic ether or compound ethers of weaker acids what has to be done ?

A little sulphuric acid has to be added to make first ethyl-sulphuric acid ; this in turn is converted into  $\text{H}_2\text{SO}_4$ , the acid radical taking its place.

### What is nitrous ether, and how formed ?

By the action of nitrous acid on alcohol.

Alcohol.

Nitrous ether.

**Into which Pharmacopœial preparation does this enter?**

Into the spiritus aetheris nitrosi, which should contain 5 per cent. nitrous ether and 95 per cent. alcohol.

**What compound amylic ether is largely employed in medicine?**

The amyl nitrite  $C_5H_{11}NO_2 = \begin{matrix} C_5H_{11} \\ | \\ NO \end{matrix} O$  formed by the action of nitrous acid on amylic alcohol.

**Describe the properties of amyl nitrite and its use in medicine.**

It is a yellow liquid, sp. gr. 0.877, boils at 95° C., insoluble in water, soluble in alcohol; when diluted it has a pleasant, but concentrated suffocating odor, flushing the face by paralyzing the peripheral capillaries and thereby relieving cardiac tension; it is used in angina pectoris, also in asthma, 5-6 drops being inhaled.

**Where are the compound ethers profusely found in nature?**

As flavors in fruits and essential oils.

**Can these flavors or oils be produced artificially?**

They can be produced artificially to resemble the natural flavors very closely. If judiciously employed they are not necessarily injurious.

**Which essential oil can be artificially produced?**

The oil of wintergreen, which is principally methyl salicylate,  $CH_3\begin{matrix} | \\ O \end{matrix} C_7H_5O_2$ , and can scarcely be distinguished from the artificial product.

**What are fats considered chemically?**

Fats are, in their chemical construction, ethereal salts or compound ethers and are acted on by alkaline hydrates like these. The process in the case of fats is termed saponification, and the product soap.

### Aldehydes.

**What is an aldehyde?**

Dehydrogenated alcohol in which O<sup>II</sup> takes the place of HO and an additional H.

**What is methyl aldehyde?**

O

||

Formic aldehyde, CH<sub>2</sub>O=H—C—H, so called because it is formic acid CH<sub>2</sub>O<sub>2</sub> minus O, and can be converted into this by oxidation.

**What is ethyl aldehyde, and what else is it called?**

C<sub>2</sub>H<sub>5</sub>O; it is also called acetic aldehyde or acetaldehyde, because it is acetic acid minus O, CH<sub>3</sub>.CO<sub>2</sub>H minus O=CH<sub>3</sub>COH, and because it can be converted into acetic acid by oxidation.

**What group or radical is present in all aldehydes?**

The radical (COH)<sup>I</sup>.

**What is paraldehyde?**

C<sub>6</sub>H<sub>12</sub>O<sub>3</sub>, a polymere of C<sub>2</sub>H<sub>4</sub>O with a vapor density three times that of aldehyde; it is a colorless liquid, sp. gr. 0.994, boiling at 124° C., of ethereal odor, and has a sharp, burning taste.

**For what purpose is paraldehyde used in medicine?**

It is a valuable hypnotic, similar to chloral hydrate, but said not to have the cardiac depressing effect of the latter.

**Chloral, what is it?**

A trichloraldehyde, CCl<sub>3</sub>COII, from which its name is derived.

**How is chloral prepared?**

By the action, for some time, of chlorine on alcohol, considerable heat being developed, and the alcohol has to be maintained at a low temperature.

**Describe the reaction by which it is formed.**

It may be considered to take place in two stages, aldehyde being formed in one and chlorine substitution taking place in another as follows :—

1. Ethylic alcohol =  $\text{CH}_3\text{CH}_2\text{OH} + 2\text{Cl} \rightarrow \text{CH}_3\text{COH} + 2\text{HCl}$ .  
Ethylic alcohol.      Ethylaldehyde.
2.  $\text{CH}_3\text{COH} + 6\text{Cl} \rightarrow \text{CCl}_3\text{COH} + 3\text{HCl}$ .  
Ethylaldehyde.      Chloral.

**What is chloral hydrate ?**

Chloral with water forms chloralhydrate

A white crystalline solid, fusing at  $57^\circ \text{ C.}$ , boiling at  $98^\circ \text{ C.}$ , volatile, soluble in water, of ethereal odor, and a sharp, burning taste.

**How does chloral behave with the alkaline hydrates ?**

It forms alkaline formitates and chloroform.

**Does chloral decompose in the body like this ?**

No, as it is eliminated undecomposed ; and besides its action is different from that of chloroform.

**How does chloral act as a poison ?**

By its cardiac depressing action it produces heart failure.

**What is the effect of chronic chloral poisoning in the chloral habit ?**

It deteriorates the blood, produces extravasations in spots, and scorbutic symptoms.

**Describe the treatment for acute chloral poisoning—chloral coma.**

Cardiac stimulants, application of hot cloths or mustard to the praecordium, keeping the body warm. Physiological antidote : strychnine.

### Monobasic Acids.

**What is the general formula of these acids, and under what name are they known ?**

Their general formula is  $C_nH_{2n}O_2$ ; they are known as the volatile fatty acids.

**Which are the principal members of this group, and their formulas?**

Formic acid  $CHO.OH$ .

Acetic acid  $C_2H_3O.OH$ .

Propionic acid  $C_3H_5O.OH$ .

Butyric acid  $C_4H_7O.OH$ .

Valerianic acid  $C_5H_9O.OH$ .

Caproic acid  $C_6H_{11}O.OH$ .

- - - - -

- - - - -

- - - - -

Palmitic acid  $C_{16}H_{31}O.OH$ .

Stearic acid  $C_{18}H_{35}O.OH$ , etc.

**What are these acids chemically?**

Products of complete oxidation of the alcoholic radical  $CH_3$ , characterized by the group  $CO.OH$ .

**Which is the acid corresponding to methyl?**

Formic acid,  $CH_2O_2=CHO.OH$ ; the acid of ants, also found in the fibres of nettles, pines, etc.; it is present in the body as an intermediate compound in the spleen and blood of persons suffering from leukæmia.

**What is the acid corresponding to the radical ethyl?**

Acetic acid  $CH_3CO.OH=C_2H_4O_2$ , the acid produced by the action of mycoderma aceti oxidizing ethylic alcohol.

also derived in the destructive distillation of wood.

**What is the acidum aceticum U. S. P.?**

A pure acetic acid, sp. gr. 1.047, containing 36 per cent  $C_2H_4O_2$ .

**Which is the purest form of acetic acid?**

Glacial acetic acid, a crystalline solid of characteristic and penetrating odor, and of caustic action.

**Vinegar, what is it?**

An impure dilute acetic acid, derived by the acetous fermentation of alcoholic liquids, such as wines, cider, etc.

**Which is the principal contamination of vinegar of the market, and how detected?**

Sulphuric acid, detected by adding cane sugar and evaporating, when the latter will turn black if  $H_2SO_4$  is present.

**What is butyric acid?**

$C_4H_7O.OH$ , occurs in the secretions, in rancid butter and in cheese, giving them their rank odor. As a compound ether, glyceryl-butyrate  $C_3H_5(O.C_4H_7O)_3$ , it gives a pleasant odor and taste to butter, and as amyl-butyrate the odor of pineapple.

**When is butyric acid present in the stomach?**

It is present in the stomach and intestines pathologically in indigestion, owing to the putrid decomposition of carbohydrates.

**What is valeric acid, where found, and in what combinations?**

$C_5H_9O.OH$ , found as compound ether in the valerian root, and as ammonium valerianate in the secretions, especially of small-pox, typhus fever, yellow fever, giving these diseases their characteristic odors ; it is also present in the faecal excretions.

**What is caproic acid?**

$C_6H_{11}O.OH$ , is present in butter, in the faeces, and perspiration.

**What is palmitic acid?**

$C_{16}H_{31}O.OH$ , occurs in glyceride or glyceryl salt, in palm oil, and olive oil, and nearly all animal and vegetable fats. It is a white crystalline, odorless, and tasteless solid, insoluble in water, but soluble in alcohol and ether.

**What is stearic acid ?**

$C_{18}H_{36}O.OH$ . The most abundant of all fatty acids, present as a glyceride in all solid fats and oils. It is a colorless, odorless, and tasteless solid, insoluble in water but soluble in alcohol and ether ; it is used in the manufacture of candles.

**To what series of acids does oleic acid belong ?**

To the acrylic series of the general formula  $C_nH_{2n-2}O_2$ .

**What is oleic acid ?**

$C_{18}H_{34}O.OH$ , occurring as a glyceride, triolein, in nearly all fats. It is a colorless or slightly yellowish liquid, odorless when pure, and does not redden litmus. It oxidizes rapidly on exposure to air. With nitric acid it changes to a crystalline isomer elaidic acid.

**What are the medicinal oleates ?**

Compounds of oleic acid with various bases or metals used for dermic medication ; those in use are the oleates of mercury, zinc, lead, copper, and of the alkaloids.

**What are mono- di- and triatomic alcohols ?**

Monatomic alcohols are those in which the radical is united with one OH, diatomic with two OH, and triatomic with three OH. The monatomic resemble KOH, the diatomic  $Ca(OH)_2$ , the triatomic  $Fe_2(OH)_6$  (1 and 3).

**Which is the most important triatomic alcohol, and what is it ?**

Glycerin  $C_3H_5(OH)_3$  ; it is the triatomic alcohol of the radical glycetyl  $C_3H_5\equiv$ .

**Describe the physical properties of glycerin.**

It is a colorless, odorless, syrupy liquid of sweetish taste, sp. gr. 1.25, at  $15.5^{\circ} C.$ , soluble in water and alcohol, insoluble in ether ; it is a good solvent for many bodies, is antiseptic, withdrawing water from other bodies.

**What results on treating glycerin with nitric acid ?**

A compound ether, trinitroglycerin, ordinarily termed nitro-glycerin  $C_3H_5\begin{array}{c} \diagup NO_3 \\ \diagdown NO_3 \\ \diagup NO_3 \end{array}=C_3H_5(NO_3)_3$  is formed.

**Describe the physical properties of nitroglycerin.**

It is a heavy viscous liquid, very poisonous, explodes with terrific force, and when mixed with other substances it is variously known as dynamite, giant powder, rendrock, etc.

Is nitroglycerin used medicinally, if so, in what form, and what is its effect?

It is used medicinally, acting like all the nitrites by relaxing the peripheral arterioles and capillaries thereby relieving cardiac tension. It is used in form of a 1 per cent. solution in alcohol.

## What are fats?

Usually a mixture of olein, palmitin, and stearin in varying proportions.

What are the oleins, palmitins, and stearins chemically?

Glycerides or compound ethers of the radical glyceryl with three molecules of the radicals of oleic, palmitic, or stearic acids.

**Give the formulas for them.**

Glyceryl tri-oleate, glyceryl tri-palmitate, glyceryl tri-stearate.

What is produced by the action of KOH or NaOH on these? Illustrate them.

Soaps are formed, the process being termed saponification.

## What are soaps then, and in what do they differ?

Salts of oleic, palmitic, or stearic acid, or mixtures of these three. Those made with KOH are of soft consistence, and are termed soft soaps; soda soaps are hard.

How do the neutral fats behave under the action of pancreatin in the body, or when treated with superheated steam?

They split up into glycerin and the fat acids.

**Name the principal properties of fats.**

They are more or less unctuous, insoluble in water, soluble in ether, chloroform, and carbon disulphide ; by means of certain media they form opaque mixtures with water known as emulsions.

**What becomes of the fats ingested ?**

Part of them is absorbed as such, others are decomposed by pancreatin, forming soaps with the alkalies, or, if not decomposed, they are emulsified ; all of it is rapidly oxidized in the body.

**From what are fats derived besides from those ingested ?**

From the proximate principles ; the smaller portion from the carbohydrates, the greater from the proteids.

**What is the province of adipose in the body ?**

It is stored up to furnish heat, and ready to be consumed if needed ; that part which is not stored produces heat directly.

**When and in what condition does fat occur in the urine ?**

When there is a direct communication established with the thoracic duct, as in chyluria ; the urine in such conditions appears milky from admixed emulsified fats ; this may be separated by shaking the urine with ether after adding a little KOH.

**What are some of the tests for fats ?**

Insolubility in water, solubility in ether, their inflammability, tendency to emulsify and form soaps, also their power to arrest the gyratory movements of camphor in water.

**What other emulsifying agent is there in the body besides pancreatin ?**

Alkali albumin, present in the intestine, forms emulsions with fats, furnishing envelopes for the fat globule.

**Which is the typical natural emulsion ?**

Milk, in which the fat is emulsified by a proteid—casein.

**What is butter ?**

A mixture of the glyceryl compounds of myristic, oleic, palmitic, stearic, caproic, and butyric acids.

**How is butter made artificially, and what called? How distinguished from butter?**

Oleomargarin or butterin is made artificially by expressing suet, and deriving the softer fats therefrom, and then mixed with milk and colored; the principal test between it and butter is the difference in their melting points.

**What is lecithin?**

A compound of cholin,  $C_5H_{15}NO_2$ , with glycero-phosphoric acid and fatty acids, present in nerve and brain tissue, and in the yolks of eggs.

**What are olefins, and which is the most important member of this group?**

The unsaturated hydrocarbons of the general formula  $C_nH_{2n}$ ; the most important of these is ethene or ethylene or olefiant gas,  $C_2H_4$ , the principal constituent of illuminating gas.

**Which of the alcohols corresponding to  $C_2H_4$  is of importance?**

The diatomic alcohol known as glycol,  $C_2H_4(OH)_2$ .

**What acid results by the complete oxidation of this alcohol?**

A diatomic and dibasic acid, known as oxalic acid.

**State its principal occurrence and properties.**

It is a crystalline solid, fusing in its water of crystallization, and subliming without decomposition; it exists in various plants, principally the sorrel, and may be artificially prepared by the action of  $HNO_3$  on sugar or cellulose.

**For what purposes is it commonly used?**

For cleaning metals, removing ink and iron stains, etc.

**Which is the principal compound of oxalic acid?**

Potassium oxalate, or better, acid- or hydro-potassium oxalate, also termed potassium binoxalate,  $KHC_2O_4 + Aq.$

**What is salts of lemon, and why does its name give rise to serious mistakes?**

Salts of lemon is potassium oxalate, used for removing ink stains; on account of its similarity in appearance to Epsom salts

it is often mistaken for it with fatal results ; also, the term, salts of lemon, inducing the belief that it is derived from lemons, and may be used in making lemonade.

### **Is oxalic acid poisonous, and what is its action ?**

In strong solutions or in substance it acts as a corrosive, by absorption from dilute solutions as a neurotic poison ; death may ensue promptly after taking it or even weeks afterwards.

### **What is the treatment for poisoning by oxalic acid ?**

Treatment to be available should be instituted at once, and consists of raw eggs, alkaline earths, magnesia in milk, chalk, plaster from the wall, etc. ; avoid diluent drinks or alkaline carbonates, they form soluble poisonous compounds readily absorbed.

### **Which are the principal tests for oxalic acid ?**

$\text{AgNO}_3$  gives a white precipitate, which, when dry, explodes on heating ; calcium hydrate or soluble salts of calcium give white precipitates insoluble in weak acids, soluble in  $\text{HCl}$  or  $\text{HNO}_3$ .

### **Which is the principal monobasic acid of this series ?**

Lactic acid,  $\text{C}_3\text{H}_6\text{O}_3$ , existing in two, if not three isomeric conditions. Ordinary lactic acid is present in the gastric juice, and is a fermentation product of milk ; it is a colorless, syrupy liquid of sour taste, and is optically inactive.

### **What is the tartaric acid of the Pharmacopœia ?**

A crystalline solid,  $\text{C}_4\text{H}_6\text{O}_6$ , one of a member of four acids of that formula, soluble in water and alcohol, of acid taste and reaction, charring at red heat ; its solution develops a fungus on standing which decomposes it ; it is tetratomic and dibasic.

### **What are the principal officinal compounds of tartaric acid ?**

Acid or hydropotassium tartrate, termed cream of tartar,  $\text{KHC}_4\text{H}_4\text{O}_6 = \text{KHT}$ .

Sodium potassium tartrate,  $\text{KNaC}_4\text{H}_4\text{O}_6 = \text{KNaT}$ .

### **What is citric acid ?**

A crystalline solid,  $\text{C}_6\text{H}_8\text{O}_7 + \text{Aq}$ , of acid taste and reaction, very soluble in water. It occurs in lemons, oranges, and other fruits. Citric acid and its salts are decomposed in the economy

into  $\text{CO}_2$  and carbonates rendering the urine alkaline ; it is tri-basic.

### **What are terpenes ?**

Unsaturated hydrocarbons of the general formula  $\text{C}_n\text{H}_{2n-4}$ .

### **Which is the most important member of this group ?**

Terebenthene,  $\text{C}_{10}\text{H}_{16}$ , on account of having a great number of isomeres in the volatile or essential oils, varying according to their physical properties, odor, and optical behavior.

### **Which are some of the principal terebenthenes used medicinally ?**

Turpentine U. S., the viscid juice exuding from pine, abies, etc., also white turpentine, Canada turpentine or balsam of fir, Veniee turpentine, Chian turpentine, and oil of turpentine.

### **What is oil of turpentine ?**

Oil or spirits of turpentine is the distillate from turpentine, containing principally terebenthene ; it is a colorless, limpid, neutral liquid, sp. gr. 0.86, oxidizing rapidly when exposed to the air, used medicinally as a diuretic and stimulant.

### **When oil of turpentine is treated with sulphuric acid what results ?**

Terpine hydrate,  $\text{C}_{10}\text{H}_{16} \cdot 2\text{H}_2\text{O} + \text{H}_2\text{O}$ , a white crystalline solid without taste or odor, soluble in hot water, alcohol, and ether.

### **What is caoutchouc and what gutta-percha ?**

They are both hydrocarbons, closely related to terebenthene ; caoutchouc, also termed India-rubber, when melted with sulphur forms what is known as vulcanized rubber, and when the amount of sulphur is increased forms hard rubber ; gutta-percha is a concrete juice of elastic consistence, which when dissolved in chloroform is the liquor gutta-percha U. S.

### **Camphors and resins, what are they ?**

They may be regarded as oxidized terpenes, usually obtained directly from plants.

### **Which is the ordinary camphor ?**

Laurel or Japan camphor,  $\text{C}_{10}\text{H}_{16}\text{O}$ , exists in several modifica-

tions; it is a colorless, transparent mass, volatile, soluble in alcohol, ether, and turpentine; sp. gr. 0.985.

**What is camphoric acid?**

A crystalline substance,  $C_{10}H_{16}O_4$ , obtained by boiling camphor with  $HNO_3$ .

**What is menthol?**

A camphor contained in the essential oil of peppermint, really a methyl alcohol,  $C_{10}H_{20}O$ , a crystalline, colorless solid, soluble in alcohol, ether, carbon disulphide, and acids.

**What forms the benzene or aromatic group?**

Unsaturated hydrocarbons of the general formula  $C_nH_{2n-6}$ .

**Which is the first and principal member of this group?**

Benzene,  $C_6H_6$ , a colorless, mobile liquid, of characteristic odor, sp. gr. 0.86, boiling at 80.5° C.; a good solvent for many resins, fats, and other substances, readily inflammable, burning with a smoky flame.

**How can the constitution of the benzene molecule be graphically demonstrated?**

By arranging it according to Kekulé, in a closed chain, in which the carbon atoms exchange alternately one or two valences,

the hydrogens of which are subject to substitution as in other hydrocarbons.

**What is the radical corresponding to benzene?**

Phenyl,  $C_6H_5-$ , a monad.

**Can the mono-substitution compound of this molecule produce isomeres?**

No; because the replacing of any one of the H leaves the others in the same relation to it.

**How can the di-hydrogen substitution compounds of this molecule differ?**

According to the manner in which they are substituted three isomeres may result.

Ortho-dibromo-benzene.

Meta-dibromo-benzene.

Para-dibromo-benzene.

The immediate substitution producing ortho-, the intermediate meta-, and the opposite para-substitution compounds.

**What is the nitro-substitution compound of benzene?**

Nitrobenzene,  $C_6H_5NO_2$ ,

A yellow oily liquid, of the odor of bitter almonds, also termed oil of myrbane, largely used in perfumery, and sometimes with disadvantage as a flavor, as it is very poisonous, producing unconsciousness, difficulty of respiration, cardiac irregularity, convulsions, and coma.

How can nitrobenzene be distinguished from the oil of bitter almonds?

By reducing the former with acetic acid and iron filings amido-benzene or aniline is formed.

What is the graphical formula of aniline?

Which is the principal alcohol corresponding to benzene?

phenyl hydrate, phenol, also, but erroneously, termed carbolic acid, phenic and phenylie acid, principally obtained by the fractional distillation of coal tar, from which it passes between 150–200° C.

What are the physical properties of carbolic acid?

A crystalline colorless solid when anhydrous, of characteristic odor; it melts at 35° C., and if 5 per cent. of water is then added to it it remains liquid; exposed to light it turns red without deterioration.

**For what purpose is carbolic acid employed in surgery?**

As an antiseptic and germicide, as a lotion and dressing for wounds, etc.; it acts like a protoplasmic poison.

**How does carbolic acid act locally?**

It produces a white eschar on the skin with a feeling of numbness, and is for that reason employed as a local anaesthetic; it coagulates and condenses the mucous membranes, leaving hard white eschars; at times it is absorbed from wounds and produces systemic effects.

**What is the toxic action of carbolic acid?**

It is a neurotic poison; stops the heart in diastole, produces giddiness, insensibility, and heart failure.

**What are the antidotes for carbolic acid?**

Olive oil, castor oil, stomach-pump, saccharated lime, magnesia.

**By what tests is carbolic acid recognized?**

Its odor; yellow crystals of picric acid forming when it is acted on by  $\text{HNO}_3$ ; purple color on addition of a ferric salt, a greenish color on addition of  $\text{NH}_4\text{OH}$  followed by sodium hypochlorite; a yellowish-white precipitate when added to bromine water; Millon's reagent (mercurous nitrate +  $\text{HNO}_3$ ) gives with it a red color when warmed (detects 1 in 200,000).

**What is the result of treating phenol with nitric acid?**

Trinitrophenol or picric acid,  $\text{C}_6\text{H}_3(\text{NO}_2)_3\text{OH}$ . Crystallizing

in brilliant yellow six-sided prisms or plates; is of a very bitter taste, not easily soluble in water, readily so in alcohol, ether, and benzene.

**For what purposes is picric acid used?**

For staining tissues yellow, also for dyeing, as a precipitant for albumin and alkaloids, and for determining sugar in urine quantitatively.

**From what besides phenol may picric acid be produced by nitric acid?**

From various organic bodies, such as indigo, aniline, resins, silk, leather, wool, and albuminoids.

**Which are the diatomic hydrates corresponding to benzene?**

Three isomeric substances, called respectively pyrocatechin, resorcin, hydroquinone, are sometimes comprised under the term oxyphenols,  $C_6H_4(OH)_2$ .

**Give the graphical formulas of these.**

Pyrocatechin, oxyphenic acid, catechol.

Resorcin or resorcinol.

Hydroquinone.

**Which of the three is used in medicine, and to what purpose?**

Resorcin, occurring in colorless and odorless short rhombic prisms, freely soluble in water, alcohol, and ether; it has been used as an antipyretic, a local caustic, and alterative.

**What is toluene?**

Another member of the aromatic series, of the formula  $C_7H_8$ , which may be viewed as a methyl benzene,  $C_6H_5\cdot CH_3$ ; a colorless liquid of characteristic odor, obtained from coal tar and the dry distillation of tolu balsam and other resins.

**What alcohol corresponds to toluene?**

Benzylic alcohol or benzoic alcohol, benzyl hydrate,  $C_6H_5\cdot CH_2\cdot OH$ .

**Which acid corresponds to this?**

Benzoic acid,  $C_6H_5\cdot CO\cdot OH$ , crystallizing in white shining needles or plates, either odorless when pure or of a pleasant odor of benzoin when prepared from this by sublimation; it is of acid reaction, monobasic, and forms salts termed benzoates.

**When benzoic acid is ingested in what form is it eliminated?**

As hippuric acid,  $C_9H_9NO_3$ , benzyl glycocoll or benzyl-amido-acetic acid, which gives the urine an acid reaction ; it is largely found in the urine of herbivora.

**What is salicylic acid ?**

$C_6H_4(OH)_2CO.OH$ , oxybenzoic acid, crystallizing in white needles, somewhat soluble in water, readily soluble in alcohol and ether ; it may be obtained from oil of wintergreen, in which it exists as methyl salicylate, but is manufactured principally from phenol ; it is a valuable antiseptic and medicinal agent.

**What is gallic acid ?**

$C_6H_2(OH)_3CO.OH$ , crystallizing in silky needles, of acid taste, slightly soluble in cold water, freely soluble in hot water and alcohol. It is obtained from nutgalls by converting the tannic acid by a fermentative process into gallic acid and extracting the latter by hot water.

**Benzoic aldehyde, what is it ?**

Benzaldehyde,  $C_6H_5O=C_6H_5CHO$ , is an essential oil of bitter almonds ; a colorless or yellowish liquid of characteristic odor, sp. gr. 1.050, boils at  $179^{\circ}C$ . It is obtained by the action of emulsin ferment on amygdalin, oil of bitter almonds, hydrocyanic acid and glucose being formed. Owing to the presence of hydrocyanic acid it is poisonous.

**What is cholesterin ?**

Cholesteric alcohol,  $C_{26}H_{43}OH$ , largely found in the animal economy, and sometimes abnormally in the biliary secretions ; when in the latter it separates to form gallstones.

**How may cholesterin be recognized ?**

By being soluble in hot ether and alcohol, from which it separates on cooling in rhombic plates ; with  $H_2SO_4$  it turns red, and on addition of water or chloroform to this it changes to green.

**What is naphthalene ?**

$C_{10}H_8$ , a white crystalline solid of characteristic odor and unctuous touch, insoluble in water, readily soluble in ether ; it

is the principal member of the unsaturated hydrocarbons of the general formula  $C_6H_{2n-12}$ . It is obtained by the fractional distillation of coal tar.

**What are its principal uses in medicine?**

It is a valuable and non-poisonous antiseptic, and is largely used as an insecticide (moth destroyer).

**Describe the arrangement of its molecule and give its graphical formula.**

It is constituted of two benzene molecules united by two of their carbons, thus :—

**What are the two hydrates of naphthalene?**

$\alpha$  naphthol and  $\beta$  naphthol, both having the formula  $C_{10}H_7OH$ ; the  $\beta$  naphthol is largely employed as a valuable antiseptic.

### Carbohydrates.

**What compounds are known under this name?**

Those composed of carbon, hydrogen, and oxygen, the carbon being present in groups of six or multiples thereof, and the hydrogen and oxygen in the proportion as in water.

**Give the principal groups of carbohydrates and their formulas.**

Celluloses. $(C_6H_{10}O_5)_n$	Saccharoses. $C_{12}H_{22}O_{11}$	Glucoses. $C_6H_{12}O_6$
Cellulose,	Cane sugar,	Grape sugar (dextrose),
Starch,	Milk sugar,	Fruit sugar (laevulose),
Glycogen,	Maltose,	Galactose,
Dextrin,	Melitose,	Arabinose.
Gums.	Melezitose.	

**Which is the purest form of cellulose ?**

Cotton, gossypium, deprived of its fat it is known and used in medicine as absorbent cotton.

**What results when cellulose is treated with  $H_2SO_4$  ?**

It first swells up and dissolves to form dextrin, which, when diluted with water and boiled, changes into glucose.

**How is parchment paper made ?**

By dipping unsized paper for a little while into sulphuric acid and washing it well before drying.

**What is pyroxilin, and how produced ?**

Nitrocellulose, gun-cotton, or collodium-cotton, is produced by the action of  $HNO_3$  on cellulose.

**Give the formula for pyroxilin.**

It may be either di-nitrocellulose,  $C_6H_8O_5\cdot(NO_2)_2$ , as in collodium-cotton or tri-nitrocellulose, gun-cotton,  $C_6H_7O_5\cdot(NO_2)_3$ .

**What is collodium, and what its varieties ?**

Collodium is a solution of pyroxilin in alcohol and ether, used in surgery, etc., for forming an artificial skin ; as it contracts very much on drying, it is made more flexible by the addition of 5 per cent. of Venice turpentine and 3 per cent. of castor oil. When mixed with the ethereal extract of cantharides it forms cantharidal collodium or blistering paint ; when mixed with tannin it is known as styptic collodium.

**What is celluloid ?**

A solution of camphor in collodium, forming on evaporation of the ether a mass which is plastic while warm and hard at an ordinary temperature.

**Which is the most important of the celluloses ?**

Amylose or starch (amylum), the fecules found in the roots, tubers, grains, etc., of plants ; it is insoluble in cold water, and separated by washing it from the crushed grain with cold water.

**What is the proportion of starch and gluten in wheat flour ?**

Starch 72 per cent. and gluten 11 per cent.

**Describe the shape, structure, and proximate composition of starch fecules.**

They are granular, irregularly oval, and of characteristic structure ; their centre is termed the hilum, which is surrounded by concentric layers or lamina : they are composed of cellulose and granulose.

**Are all fecules of starch from various sources alike, and what is their common characteristic?**

Starch fecules from different sources vary, but all are polarized in characteristic form, representing a Maltese cross centred in the hilum.

**By what tests can starch be recognized?**

1. Starch is insoluble in cold water, but on boiling forms a transparent mucilage or gelatinous mass ; this when diluted sufficiently is known as starch-water.

2. Treated with a solution of iodine starch gives rise to a bluish-black precipitate, which is dissolved by KOH or Cl, and also by heat.

3. Boiled with dilute acids starch is converted into dextrin and glucose.

**What is dextrin ?**

One of the celluloses, sometimes termed British gum, and is obtained by exposing starch to dry heat of 175° C. It is a yellow amorphous powder, soluble in water, forming mucilage ; with iodine it gives a red color, and does not reduce alkaline cupric solutions.

**Which of the celluloses are termed gums ?**

Carbohydrates, soluble in water, insoluble in alcohol, and capable of being converted into glucose by H<sub>2</sub>SO<sub>4</sub> ; the principal members of this group are acacia and tragacanth.

**Glycogen, what is it, where found, properties, and destiny ?**

Animal starch, belonging to this group, is found in the liver,

in the muscles, in oysters, and in embryonic structures; it is principally derived from carbohydrates, but also from proteids. It is probable that it furnishes muscle energy, as there is less present in the muscles after muscular efforts; it is claimed to be stored up in the liver as colloidal glucose, from which it can be changed into diffusible glucose by a special ferment; it is not present in the blood.

Which carbohydrates are known as saccharoses?

Those having the formula  $C_{12}H_{22}O_{11}$ .

Which is the principal one, and where found?

Cane sugar, found in sweet fruits, and other parts of saccharine plants, such as sugar-cane and beet-root, from which it is obtained by expression and crystallization.

**What are the different forms of cane sugar?**

Ordinary table sugar, rock candy, lower grades, molasses or treacle and caramel; molasses remains after the crystallization of the former; caramel is burned sugar forming at 210° C., used for coloring liquors.

**What are the properties of cane sugar?**

It is very sweet to the taste, of monoclinic crystalline structure (oblique prisms), dextro-rotatory; boiled with dilute acids it is hydrated into dextrose and laevulose.

**Why is the latter called inverted sugar?**

Because the rotatory power exercised on it by polarized light is inverted, *i. e.*, laevo-rotatory; laevulose is sweeter than glucose but uncrystallizable.

Describe the distinctions between glucose and cane sugar.

Cane sugar does not reduce the alkaline cupric solutions directly ; it does not ferment as such, but has to be converted into glucose first ; cane sugar chars with  $H_2SO_4$ , glucose does not.

## What is lactose, and how derived?

Sugar of milk  $C_{12}H_{22}O_{11}$  + Aq, made from the whey of milk

as a by-product in the manufacture of cheese, crystallizing from this after concentration on foreign bodies, such as strings, sticks, etc., inserted into it.

### **Describe its properties.**

It is crystalline, not so soluble nor so sweet as the other sugars, reduces the alkaline cupric solutions, is dextrorotatory and ferments, changing into alcohol, carbon dioxide and lactic acid (koumys).

### **Glucose, what is it ?**

Grape sugar or dextrose  $C_6H_{12}O_6$ , found on raisins, in honey, and derived from other carbohydrates such as starch, etc., also from glucosides by the action of dilute acids and ferments.

### **How is glucose manufactured ?**

By treating starch with  $H_2SO_4$ , precipitating the acid with  $CaCO_3$  and concentrating the liquid.

### **For what purposes is glucose principally used ?**

As a substitute for the syrups of the market, honey and table syrups being largely glucose ; the solid grape sugar is manufactured into candies to a great extent.

### **Is this substitution injurious to the health ?**

Not if the glucose is made from pure materials, as all sugars and carbohydrates have to be converted into glucose before they are assimilated.

### **Which is the most important chemical property of glucose ?**

That it reduces the metallic oxides.

### **Is glucose present in the urine in normal conditions, and in which disease is its presence abnormally great ?**

Minute traces of glucose are normally present in the urine, slightly increased at times by various physiological or pathological changes ; when present in the urine in larger quantities and persistently, it characterizes the disease known as diabetes mellitus.

### **What caution should be observed in testing urine for glucose ?**

That it should contain no albumin ; if present, it should first be separated by boiling and subsequent filtration.

**What is Moore's test for sugar in urine?**

To boil for a few moments a mixture of equal parts of the urine and KOH solution. If glucose is present the mixture will turn deep yellow or brown.

**What is Boettger's test?**

The alkaline bismuth test ; boil equal parts of urine and KOH solution to which a pinch of bismuth subnitrate is added ; if glucose is present the white bismuth salt will turn dark gray or black, being reduced to metallic bismuth. (*See Bismuth.*)

**Is this test always admissible?**

If albumin or sulphur compounds are present it is not ; to ascertain this boil with litharge first instead of the bismuth, if the litharge blackens, this test cannot be employed.

**Which is the principal test for sugar in urine?**

The alkaline cupric test, in which the cupric oxide, held in solution by KOH or NaOH and some organic substance, is at the boiling point reduced to cuprous oxide. (*For reaction, see Copper.*)

**Trommer's test, how is it performed?**

To a little urine in a test-tube add an equal volume of KOH solution and a few drops of CuSO<sub>4</sub> solution. Heat to the boiling point ; if sugar is present yellow or red cuprous oxide is precipitated.

**Haines' test, how applied?**

To some KOH solution in a test-tube add a few drops of solution of CuSO<sub>4</sub> and a few drops of glycerin ; boil this and after removing from the flame add gradually some of the suspected urine ; if glucose is contained in it, a yellowish-red precipitate of cuprous oxide will be thrown down.

**What is Fehling's solution?**

A solution of NaOH and sodium potassium tartrate (Rochelle salt), to which a solution of CuSO<sub>4</sub> is added.

**State the disadvantage of Fehling's solution, and how obviated.**

Fehling's solution does not keep well, and should therefore

not be kept ready made for any length of time ; to obviate this, the alkaline solution of Rochelle salt and the CuSO<sub>4</sub> solution should be kept separate, as follows :—

R. CuSO<sub>4</sub> 34.64 grams, water q. s. to 500 c.c.

R. Rochelle salt (crystallized) 173 grams, Sol. NaOH (sp. gr. 1.34) 100 c.c., water q. s. 500 c.c.

For use, mix equal volumes as needed.

### **How is glucose detected with Fehling's solution ?**

By boiling in a test-tube some of the solution, and after removing it from the flame add a little of the suspected urine or fluid ; if no reaction takes place, heat again, and add more urine in the same manner ; if glucose is present, yellow or red cuprous oxide will be precipitated.

### **In which way may glucose be quantitatively determined with Fehling's solution ?**

Place into a capsule, beaker, or flask 10 c.c. of Fehling's solution, diluted with 40 c.c. of water. Heat to the boiling-point, and let gradually run into it from a burette a mixture of one part of urine and nine of water, stirring the mixture until the blue color of the test solution has entirely disappeared. Repeat this several times until the amount of diluted urine used proves the smallest quantity effecting complete reduction.

### **How is the amount of glucose computed from this process ?**

As the 10 c.c. Fehling's solution can be reduced by exactly 0.05 glucose, the amount thereof present in the mixture of urine and water corresponds to this. As the quantity of the mixture used out of the graduated burette equalled  $\frac{1}{10}$  of the urine to be examined, this (1 in 10) contained 0.05 grams of glucose. Thus if 16 c.c. diluted urine (1 in 10) were used, 1.6 c.c. urine contained 0.05 grams of glucose. To obtain the percentage the following proportion will answer :  $1.6 : 0.05 = 100 : x$  ;  $x = 3.1$  per cent.

### **What is Johnson's picric acid test for the quantitative determination of glucose in urine ?**

It consists of converting picric acid in the presence of KOH and glucose into reddish-brown pieramic acid ; the intensity of the color of the latter being proportionate to the amount of glu-

cose present ; the color of the picramic acid formed is then compared with that of a standardized solution of ferric acetate, and thus the amount of glucose ascertained.

**How is this test performed ?**

Take of urine fʒj, liquor potassæ fʒss, solution of picric acid (gr. 5.3 to fʒj), m. xl. water q. s. ad fʒiv into a test-tube, and boil for sixty seconds ; after which cool the mixture, and bring it up to the original volume (fʒiv). Of this pour 10 c.c. into a 100 c.c. graduated cylinder, which has attached to it a test-tube of equal diameter and containing the standard fluid ; dilute the boiled mixture to equal in color the standard liquid, and for each 10 c.c. it has been diluted up to, count 1 grain of glucose in the ounce of urine tested.

**What is the standard ferric acetate solution composed of ?**

R. Liquor. ferri chloridi fʒj ;  
Ammonii carb. ʒj ;  
Acidi acetici fʒv ;  
Aquæ destillat. q. s. ad fʒiiiss.—M.

**How is the quantity of glucose in urine determined by Roberts' differential density method ?**

Take the specific gravity of the urine to be tested, and take of this about 4 fluidounces, with this is mixed up a small quantity of compressed yeast ; set aside for 24 hours in a warm place until fermentation is complete, and then take the specific gravity of the fermented urine ; subtract this from the first amount, and for each degree of sp. gr. lost, there is one grain of glucose present in the fluidounce of urine.

**By what other process may sugar be quantitatively determined ?**  
By polarization.

**What is polarized light ?**

When a ray of light passes through a feldspar prism (Nicol's prism), it is deflected in two directions, one of which is termed refracted and the other polarized.

**What is the effect of sugar, proteids, and other optically active substances on polarized light passing through their solutions?**

They deviate it in accordance with their individual composition and the density of their solutions.

**What are polarizing saccharimeters, and what their component parts?**

Instruments to ascertain the quantity of sugar in a fluid to be examined; they are composed of a polarizer, a container, an analyzer, and a graduated arc for reading off the angle of deviation.

**What is the specific angle of rotation of glucose, and how is the quantity of sugar computed from the observed angle?**

+ 56, and the formula for computation is  $\frac{100 \times \text{angle}}{56}$ , thus if 2.8° were the observed angle the formula would read

$$\frac{100 \times 2.8}{56} = \frac{280}{56} = 5 \text{ per cent.}$$

### Glucosides.

**What are glucosides?**

Various subacid or neutral principles obtained mostly from plants; they have the characteristic property of splitting up under the action of ferments or acids into glucose and other bodies.

**As what may they be chemically regarded?**

As compound ethers or ethereal salts of the glucoses.

**Name the principal glucosides, and what is the rule adapted regarding their nomenclature?**

Their names have the terminal syllable "in" in English and "inum" in Latin, in contradistinction to the alkaloids, which terminate respectively in "ine" and "ina." The principal ones of interest in medicine are amygdalin, colocynthin, digitalin, glycyrrhizin, jalapin, salicin, santonin, and the tannins.

**What is amygdalin, and how does it split up?**

A crystalline glucoside,  $C_{10}H_{27}NO_{11}$ , present in and obtained

from bitter almonds, cherry-laurel leaves, wild-cherry bark, and other plants of the amygdalæ and pomeæ. By the action of boiling dilute acids or the ferment emulsin it splits up into oil of bitter almonds, hydrocyanic acid, and glucose as follows:—

What is digitalin, and what does it split up into?

A complex body resolved into digitonin, digitalin, and digitalein; with  $H_2SO_4$  it splits up into glucose and digitaliretin,  $C_{15}H_{25}O_5$ .

By what test may digitalin be recognized?

Dissolved in  $H_2SO_4$ , it yields a green color, which, on addition of bromine water, changes to a reddish-violet, and on dilution with water, emerald green.

What is salicin, and how does it split up?

A white crystalline glucoside,  $C_{13}H_{18}O_7$ , derived from the bark of the willow; with acids it splits up into glucose and saligenin.

Which glucoside is obtained from santonica?

Santonin,  $C_{15}H_{18}O_3$ , shining crystals which split up with acids into glucose and santoniretin.

## Which is the tannin of the U. S. P.?

The glucoside obtained from nutgalls, also known as gallo-tannic acid; it is now regarded not as a tannin or glucoside proper but as a digallic acid; it has the formula  $C_{14}H_{10}O_9$ , and under the action of boiling dilute acids or alkalies it is changed into gallic acid.

Inversely gallic acid can be changed into gallotannic acid.

What are the reactions for gallotannic acid?

With solutions of ferric salts it gives dark bluish-black precipitates; no precipitate with ferrous salts, but gradually forming on exposure and oxidation; this is known as ink; with gelatin, albuminoids, and alkaloids it forms precipitates.

### Substituted Ammonias.

**What is meant by these?**

Compounds forming on the ammonia type, *q. v.*

**Which are the compounds so forming?**

Amines, amides, imides, alkalamides, and amido-acids.

**What are amines?**

Ammonia  $\text{NH}_3$ , in which one or more H is replaced by electropositive (alcoholic) radicals.

**Give the formulas of mono-, di-, and trimethylamine.**

Methylamine,  
or primary methylamine.

Dimethylamine,  
or secondary methylamine.

Trimethylamine,  
or tertiary methylamine.

**How do the amines behave towards acids?**

They have basic properties like ammonia, and like it they unite directly with acids to form salts.

**Amidogen, what is it?**

The radical  $\text{NH}_2-$ .

**What are amido-acids?**

Monobasic or fatty acids, in which one H of the alcohol radical is substituted by amidogen, and having both acid and basic functions.

**What is the most important one of these?**

Amido-acetic acid,  $\text{CH}_2\text{NH}_2\text{COOH}$ , known as glycocol or glycine.

**In what acid of the body is glycine contained?**

In glycocholic acid,  $\text{C}_{26}\text{H}_{43}\text{NO}_6$ , found as sodium glycocholate in the bile and during icterus in the blood and urine.

**How does glycocholic acid split up?**

Into cholic acid and glycocol.

**Which other acid is associated with this in the bile?**

Taurocholic acid,  $\text{C}_{26}\text{H}_{45}\text{NO}_7\text{S}$ , as sodium taurocholate.

**Into what can this be split up?**

Into cholic acid and taurin.

**Under what name are these two acids commonly known, and by what reaction recognized?**

They are known as the biliary acids, and recognized by the Pettenkofer's reaction.

**How is the Pettenkofer's reaction applied, and what has to be done when used for testing urine or blood?**

A minute quantity of cane sugar is added to their solutions, and this floated on  $\text{H}_2\text{SO}_4$  in a test-tube, when a fine purple color will appear at their line of contact. In applying this to urine or blood, the fluids must be evaporated, the residue extracted with alcohol, and this mixed with ether, the precipitate resulting is dissolved with water and tested as above.

**What is leucine?**

Amido-caproic acid,  $\text{CH}_3(\text{CH}_2)_3\text{CH.NH}_2\text{COOH} = \text{C}_6\text{H}_{13}\text{NO}_2$ , found in the urine of those suffering from hepatic diseases, principally in acute yellow atrophy, appearing as spheres under the microscope.

**What other substance is associated in such conditions with leucine in the urine?**

Tyrosine,  $\text{C}_9\text{H}_{11}\text{NO}_3$ , appearing under the microscope as stellar bundles or sheaves.

**What is creatine and what creatinine?**

Creatine,  $\text{C}_4\text{H}_9\text{N}_3\text{O}_2$ , methyl glycocyanine, is another amido-acid found in the animal organism, especially in the juice of muscles, and also in the brain, blood, and amniotic fluid. Creatinine,  $\text{C}_4\text{H}_7\text{N}_3\text{O}$ , a product of dehydration of creatine, is normally present in the urine, and obtained from this as a zinc compound by precipitation with zinc chloride.

**When the hydrogen of ammonia is substituted by electronegative or acid radicals, what results?**

Amides, thus acetamide is  $\text{CH}_3\text{CO.O.NH}_2$ ; if respectively one or

more of the H of NH<sub>2</sub>, they form primary, secondary, or tertiary amides ; if a multivalent acid radical replaces one H in more than one group of NH<sub>2</sub>, they are termed R di- or R tri-amide.

**What is carbonyl di-amide ?**

Carbamide or urea, CO''<sup>NH</sup><sub>2</sub>=CON<sub>2</sub>H<sub>4</sub>, an isomere of ammonium cyanate, NH<sub>4</sub>.CON.

**How does urea originate in the body, and how is it excreted ?**

Urea is the final product of elimination of all nitrogenous food entering the body ; it is principally eliminated by the kidneys in quantities of about 500 grains daily ; more or less influenced by the amount of albuminous food ingested and the condition of the skin, bowels, and kidneys.

**What are the properties of urea ?**

It is neutral, odorless, of a cooling bitter taste, very soluble in water and alcohol, insoluble in ether ; it crystallizes in four-sided transparent prisms with bevelled edges ; it forms crystalline compounds with acids, bases, and salts.

**How is the oxalate or nitrate of urea prepared from the urine ?**

By acidulating condensed urine either with oxalic or nitric acid, crystals of urea oxalate, (CH<sub>4</sub>N<sub>2</sub>O)<sub>2</sub>C<sub>2</sub>H<sub>2</sub>O<sub>4</sub>+2Aq, or urea nitrate, CH<sub>4</sub>N<sub>2</sub>O.HNO<sub>3</sub>, separate on cooling.

**What is the compound of urea with mercuric oxide ?**

A white precipitate of the formula CH<sub>4</sub>N<sub>2</sub>O.3HgO.

**How is urea decomposed by sodium hypobromite or hypochlorite ?**

Into sodium chloride or bromide, carbon dioxide, water, and nitrogen.

**In which way is this utilized ?**

In different processes for the quantitative determination of urea in the urine.

**What is the differential density or Fowler's method for the determination of urea in urine ?**

The process of decomposing the urea therein with Labar-

raque's solution and comparing the loss of specific gravity, which is in direct proportion to the urea decomposed.

**How is this process carried out ?**

Take the specific gravity of the urine accurately, also that of the liquor sodae chloratæ ; the latter multiply by 7, and to the product add the specific gravity of the urine ; the sum of the two divided by 8 gives then the specific gravity of a mixture of 1 volume urine and of 7 of the hypochlorite solution. Then add 1 volume of urine to 7 of liquor sodae chloratæ, allow the mixture to stand for several hours until effervescence has ceased, and take the specific gravity of the mixture ; this subtracted from that representing the mixture before reaction gives the difference, which, if multiplied with 0.77, corresponds to the percentage of urea present in the urine.

**On what process does Liebig's method for the quantitative determination of urea depend ?**

On the formation of urea compounds with mercuric oxide, a standard solution of mercuric nitrate being used with sodium bicarbonate as an indicator.

**How is this process conducted ?**

Urine is deprived of its sulphates and phosphates with baryta water ; after filtration it is titrated with the standard solution of mercuric nitrate, an excess of which is indicated by the sodium bicarbonate.

**What is known as the Russell and West's method for determining the urea in urine ?**

That based upon the decomposition of the urea by either the alkaline hypobromite or hypochlorite of sodium, and measuring the volume of nitrogen evolved which is converted into weight, and as such corresponds in a certain ratio with the amount of urea decomposed.

**What apparatus is used for this purpose, and how is the process conducted ?**

It consists of a flask containing a test tube with the urine to be examined ; around this tube in the bottle is the NaClO or

NaBrO solution ; connected with a glass tube through its stopper is a rubber tubing communicating with an inverted graduated burette floating in a cylinder of water. When the flask with the tube is inclined so that the urine will mingle with the Na BrO or NaClO solutions it is decomposed, the CO<sub>2</sub> being absorbed by the alkaline solution present while the N enters into the graduated burette displacing the water therein and is so read off in c.c. ; these are converted into urea by multiplying with 0.0027, giving in grams the urea present in the urine decomposed.

**How is the alkaline sodium hypobromite solution (Knop's solution) prepared ?**

100 grams NaOH are dissolved in 250 c.c. water, and to this 25 c.c. bromine are added.

**In order to have accurate results what must be done ?**

The volume of nitrogen read off must be corrected for barometric pressure and temperature.

**What formula is used for this purpose ?**

$$V' = \frac{v(b-w)}{760(1+0.00366 t.)}$$

in which V' = is the volume required ; v = volume observed ; b = barometric pressure ; w = tension of aqueous vapor ; t = observed temperature centigrade.

**How does urea split up under the influence of the micrococcus ureæ ?**

It unites with water and forms ammonium carbonate.

**In which morbid conditions is the amount of urea increased in the urine, and in which diminished ?**

During increased metabolism ; in febrile and inflammatory affections it is increased, also in the different forms of diabetes ; in acute yellow atrophy of the liver it may be entirely absent ; in acute and chronic forms of Bright's disease it may be greatly diminished, causing low sp. gr. of the urine, and giving rise to uræmia from being retained in the circulation.

**What is uric acid, and in what form is it derived from the urine?**

It is a compound urea,  $C_5H_4N_4O_2$ , derived from the urine as a colored microscopical crystal of lozenge shape, either solitary or in clusters, the angles corresponding to the shortest diameter being rounded off.

**Does uric acid occur free in the urine normally?**

It does not occur free in normal urine but as salts, sodium, potassium, or ammonium urate ; these are also found in the blood during gout and in fevers.

**What is the clinical significance of the presence of free uric acid in the urine?**

When present at micturition or shortly afterwards it may give rise to the formation of gravel.

**How does uric acid form in the system?**

As result of suboxidation of albuminoids, as an incomplete product in the formation of urea.

**Of what are gout stones principally composed?**

Sodium urate.

**What are the properties of pure uric acid?**

A white crystalline powder, odorless and tasteless, very little soluble in water, dissolving without decomposition in strong  $H_2SO_4$ , from which it is precipitated on addition of water ; it is a dibasic acid forming with the alkaline bases both normal and acid salts.

**What is the solubility of uric acid?**

1 in 15,000–18,000 ; it is one of the most insoluble products of the body.

**Why do urates form deposits in joints and cartilages?**

Because they are poorly supplied with blood, which is a solvent for them.

**What is the reaction of blood during gout?**

It is less alkaline than normally.

**Why are alkalies indicated in gout?**

Because they increase the alkalinity of the blood so as to favor the elimination of the urates.

**What diet and manner of living favor the formation of uric acid?**

Red meats, heavy wine, rich food, and lack of exercise.

**How is uric acid recognized chemically?**

By the murexide test; to apply this dissolve the substance to be examined in a few drops of  $\text{HNO}_3$ , the solution is then reduced to dryness by gentle heating, leaving a yellowish residue; if this is moistened with  $\text{NH}_4\text{OH}$  a beautiful purple color, murexide, is developed if uric acid is present.

**How is the amount of uric acid in urine determined?**

200-300 c.c. urine are acidulated with 5-10 c.c. HCl and allowed to stand for 24 hours when the crystals formed are collected and washed on a tared filter; the dried filter being weighed, the increase of weight gives approximately the amount of uric acid.

### Alkaloids.

**What are alkaloids?**

Nitrogenized vegetable compounds of basic character, forming salts with acids, by directly combining with them like ammonia.

**How are they subdivided?**

According to their physical condition into volatile and fixed alkaloids; those containing no oxygen are mostly liquid and volatile; others containing it are solid and non-volatile.

**What are they chemically?**

Tertiary (like the quinoline and pyridine bases) and secondary amines as far as they have been studied.

**How do alkaloids behave towards solvents?**

The free or basic alkaloids are generally insoluble or very little soluble in water, but soluble in ether, chloroform, amylic alcohol,

benzin, carbon bisulphide, alcohol, and acids ; as salts they are insoluble in these, but as a rule soluble in water.

### **Have all plants different alkaloids ?**

Different plants may have identical or analogous alkaloids, several natural orders having similar or analogous ones ; one plant may have a number of them ; thus nux vomica has three, ignatia has three, cinchona four, opium about twenty-one, etc.

### **Which are the general characteristics of alkaloids ?**

They are alkaline ; form precipitates with tannic acid, forming insoluble tannates (for that reason tannin is used as an antidote for them) ; they are precipitated also by the fixed alkalies, also by phospho-tungstic acid, ammonium molybdate, potassium iodo-hydargyrate, platinic chloride, picric acid, etc.

### **Why is it difficult to separate and determine poisonous alkaloids from cadavers ?**

Their separation is intricate and requires delicate manipulation ; then they are present as a rule in minute quantities only ; they are besides generally subject to decomposition during the decay of the body, and finally their differentiation from ptomaines offers great difficulty, as they often possess the same color reactions, and in some instances similar physiological effects.

### **What must be done to establish the identity of an alkaloid ?**

All the color tests must answer, besides the physiological action and taste.

### **On what depends the Staas-Otto method for extracting alkaloids ?**

Upon the fact that their acid salts are soluble in water, and can be rendered insoluble therein by alkalies as free bases ; as such they are taken up by ether or chloroform, amylic alcohol, carbon bisulphide, etc., and from these recovered by evaporation of the solvents.

### **Which are the principal liquid alkaloids ?**

Nicotine  $C_{16}H_{14}N_2$ , coniine  $C_8H_{15}N$ , piperidine  $C_5H_{11}N$ , and sparteine  $C_{15}H_{26}N_2$ .

**From what plant is nicotine obtained, and what are its properties?**

It is obtained from tobacco ; it is a colorless oily liquid of characteristic odor, is very poisonous, producing nausea, cold sweats, giddiness, cardiac depression, and difficulty of respiration. Treatment : wash out the stomach with a strong infusion of tea, charcoal, and stimulants.

**Where is coniine obtained from, and what are its properties?**

Coniine is obtained from hemlock (*conium U. S.*) ; it is a colorless volatile liquid, of strong alkaline reaction, and penetrating odor. With HCl its vapors give rise to white clouds, as is also the case with NH<sub>3</sub> ; it is a powerful poison, causing paralysis of the muscles of the extremities, and when reaching the muscles of respiration death ensues from apnea. Treatment, as in nicotine poisoning, with artificial respiration.

**Which are the principal alkaloids from cinchona?**

Quinine, quinidine, cinchonine, and cinchonidine.

**What is quinine, and how recognized?**

Quinine, C<sub>20</sub>H<sub>21</sub>N<sub>2</sub>O<sub>2</sub>, is in its basic state an amorphous white powder ; it is freely soluble in acids, with which it forms crystalline salts, the sulphate being the one most in use ; its acid solutions are fluorescent ; treated with chlorine it turns green on the addition of NH<sub>4</sub>OII, or red if potassium ferrocyanide is added.

**Which are the principal opium alkaloids, and with what acid are they united in opium?**

Morphine, codeine, narceine, narcotine, etc., united with meconic acid, as meconates in the natural state.

**What is morphine, and what its properties?**

An alkaloid of opium, C<sub>17</sub>H<sub>21</sub>NO<sub>3</sub>+Aq, crystallizing in truncated prisms of alkaline reaction, combining with acids to form salts. The alkaloid is insoluble in ether and chloroform, very little soluble in water, more so in alcohol, and also in acetic ether ; its salts are soluble in water and alcohol ; insoluble in acetic ether.

**Which are the symptoms produced by morphine poisoning ?**

Regular breathing, moist skin, livid lips, blue nose ; further on irregularly rhythmical (Cheyne-Stokes) breathing, and coma. This is always an alarming symptom, but recovery is still possible, and the efforts to restore the patient should not be given up.

**How does morphine or opium in toxic doses affect the pupils ?**

They are contracted ; other alkaloids, such as eserine, aconitine, and strychnine, produce the same effect, but the general symptoms produced by them are different. It is to be remembered however that in apoplexy, involving the Pons varolii, the pupils are also contracted as in opium poisoning.

**How soon may death result from morphine poisoning ?**

Symptoms may come on in from 15-30 minutes to an hour or three hours ; dry pills may not produce effects for 6-12 hours. Death may take place in 45 minutes, but usually not before 8-10 hours.

**What is the treatment of poisoning by morphine or opium ?**

Use the stomach pump ; if early enough emetics, mustard, salt and water, and zinc sulphate ; if no emesis is induced by these in a short time they must be abandoned. Wash out the stomach with strong tea, give animal charcoal, use faradism and artificial respiration, flagellation with wet towels, to keep up respiration by reflex irritation, best to the region of the trigeminus, keep the patient moving and awake, strong coffee, enemata with brandy ; atropine is good as a respiratory stimulant.

**By which tests can morphine be recognized ?**

$\text{HNO}_3$ , orange-yellow color, shading off into yellow.  $\text{Fe}_2\text{Cl}_6$ , greenish-blue. Iodine acid is reduced by morphine, rendering color of solution brownish from free iodine, changing to bluish-black on addition of starch water.

**What is tested for in looking for opium, and how ?**

Meconic acid : this gives a red color with ferric chloride, extinguished by stannous chloride, but not by mercuric chloride.

**What is strychnine, and its properties ?**

An alkaloid extracted from nux vomica and ignatia, crystal-

lizing in various modified forms of octahedra and four-sided prisms, which latter predominate. It is odorless, but of very bitter taste, and said to be recognizable when so dilute as 1 in 100,000, and can be readily recognized 1 in 50,000, and 1 in 10,000 it is distinctly bitter; it is soluble in 7000 parts of water, 1 in 1000 carbon disulphide, 1 in 340 ether, 1 in 100 alcohol, and 1 in 10 chloroform; it is markedly basic and stable.

### **Which is the principal salt of strychnine?**

Strychnine sulphate  $\text{St}_2\text{H}_2\text{SO}_4$ ; it does not char or color with  $\text{H}_2\text{SO}_4$ ; dissolves in 10 parts of water and 60 alcohol; it is the principal ingredient in various vermin killers, and is largely used for destroying animals.

### **What symptoms does strychnine produce in poisonous doses?**

Tetanic spasms; muscles of respiration are rigidly contracted, producing a sensation of suffocation; every muscle becomes contracted, lasting from  $\frac{1}{4}$ -1 minute; opisthotonus, broad grin, great pain, lockjaw, respiratory muscles and diaphragm fixed, pupils contracted, dilating with relaxation of spasm; spasms come more and more rapidly until the victim dies of asphyxia and exhaustion.

### **What is the fatal dose of strychnine and its effect on infants?**

Fatal dose 1-2 grains, but recovery has been reported from 40 grains. Infants may be poisoned by strychnine through the mother's milk, though the mother is not affected; this is attributable to the more irritable spinal cord of children.

### **How are cases of strychnine poisoning to be treated?**

Give the usual antidotes for alkaloids, but if the patient resists or cannot take them on account of spasm, put him partially under the influence of chloroform and then give emetics and antidotes.

### **If emetics fail what is to be done?**

Use the stomach-tube through perforated gag to prevent the patient from biting it during spasm, and inject through this strong infusions of oak bark or tea or solutions of tannin, and wash out the stomach thoroughly.

**What are physiological antidotes for strychnine?**

Chloroform, chloral, bromides ; chloral by rectum 30-60 grains as required.

**How may strychnine be recognized?**

By the bitter taste, 1 in 10,000 or 5000 must give it distinctly ; the bitter taste is even more delicate than the color test ; if it is not bitter it is not strychnine, but though bitter it may be something else ;  $H_2SO_4$  produces no change with strychnine, but by the action of nascent oxygen it gives rise to a play of colors from blue to purple, violet, crimson, and orange-yellow.

**How is nascent oxygen generated in the color-test for strychnine?**

By  $H_2SO_4$ , to which is added a small fragment either of potassium bichromate or permanganate, or else manganese dioxide or lead peroxide.

**What is known as the Marshall Hall's test?**

The physiological test ; it is done by injecting some of the suspected liquid subcutaneously into a small frog ; if strychnine is present the animal will have tetanic spasms, etc.

**What is brucine and its properties?**

It is an alkaloid associated with strychnine in nux vomica and iognatia, frequently contained in the strychnine of the market ; in action it only represents about  $\frac{1}{6}$  the strength of strychnine ; test for brucine is  $HNO_3$  with which it turns bright red (brucine is also a test for  $HNO_3$ ).

**Which alkaloids derived from the solanaceæ are isomeric?**

Atropine, from atropa belladonna, analogous to daturine from datura stramonium, hyoscyamine from hyoscyamus niger, and duboisine from duboisia myoporoides, all of which have the formula  $C_{17}H_{23}NO_3$  and similar effects, dilating the pupils, and therefore termed mydriatics.

**What is atropine?**

An alkaloid of atropa belladonna, probably existing as a malate in the plant (daturine may be considered as analogous to it) ;

it is soluble in 400 parts of water, is of alkaline reaction, and freely soluble in alcohol, ether, and chloroform.

### **What is homotropine?**

A synthetical product obtained from tropine and mandelic acid ; it is employed as a substitute for atropine.

### **What are the symptoms of poisoning by atropine?**

Giddiness, drowsiness, thirst, incoherent speech, and almost loss of articulation, dry mouth and throat, strong pulse, occasional vomiting, flushed face (erythema), dilated pupils, delirium, ischuria, coma, but death not usual ; cause of poisoning most frequently from eating the berries of the deadly nightshade.

### **What antidotes should be employed in cases of poisoning by atropine?**

Emetics, zinc sulphate, apomorphine hypodermically ; stomach-pump if these fail ; wash out the stomach with strong infusions of tea, oak-bark, or tannin solutions, and charcoal.

### **By which test can atropine be recognized?**

With  $H_2SO_4$  and a fragment of potassium bichromate it gives rise to an odor of orange blossoms or attar of roses and a green color.

### **What is the principal alkaloid of aconitum napellus?**

Aconitine,  $C_{33}H_{43}NO_{12}$ , producing numbness and tingling of mouth, fauces, and extremities, cardiac failure, and death by syncope. The physiological effect on the tongue is the best test for its detection. Antidotes, same as for other alkaloids, together with cardiac stimulants.

### **What are ptomaines?**

The basic products derived during the process of decay of cadaveric bodies.

### **What are leucomaines?**

The basic products derived from organized bodies during life by the retrograde chemical process.

### **Are the ptomaines constant chemical bodies?**

No, they vary according to the stage and the conditions supervening during decay, and are quite unstable.

**How do the ptomaines compare with other amines?**

Some of the well-known amines are produced during decay as ptomaines.

**Are they all poisonous, and by what terms are the poisonous ptomaines known from the non-poisonous?**

They are by no means all poisonous; but for those of a poisonous character the affix of "toxine" has been proposed, such as typhotoxine, etc.

**Name some of the known ptomaines.**

Neurine, neuridine, muscarine, cadaverine, mydæline, sepsine, saprine, putrescine, collidine and hydrocollidine, mydatoxine, mydine and methylguanidine, typhotoxine, and tyrotoxicon, etc.

**What is tyrotoxicon?**

The poisonous ptomaine of putrid cheese and putrid decomposition of milk; it is claimed to be a diazobenzol,  $C_6H_5N_2C_6H_5O_2$ .

**Name some of the leucomaines.**

Guanin, xanthin, hypoxanthin, creatin, and creatinin.

### Proteids.

**What are proteids or protein bodies?**

Albuminoids or albuminous bodies constituting the principal component of the animal organism, and also present in plants and seeds.

**How are they chemically constituted?**

Their molecules have a very complex composition, but always contain nitrogen.

**In which way can they be studied?**

By their products of decomposition, resulting both from chemical and putrefactive changes.

**What are the two principal states in which they occur?**

In the soluble and insoluble state; the latter being derived from the former by heat and various chemical bodies; the in-

soluble albuminoids cannot be directly reconverted into the soluble.

**Of what elements are the albuminoids principally composed ?**

Carbon, oxygen, nitrogen, hydrogen, and sulphur.

**Which are the general tests for the recognition of albuminoids ?**

With the alkaline cupric (Fehling's) solution they give a violet coloration ; with strong nitric acid they give a yellow coloration, changing with ammonia water to a brownish-red on cooling ; this is known as the xanthoproteic reaction ; with Millon's reagent they give a rose or red coloration.

**What are the two principal albumins ?**

Eggalbumen as occurring in white of eggs, and serumalbumin as present in the serum of the blood.

**How can these two be distinguished ?**

Eggalbumen coagulates when shaken with ether ; serumalbumin does not.

**What is serumalbumin ?**

In its dry state it is yellowish and transparent ; it exists in solution in the serum of the blood and other fluids of the body, and pathologically also in the urine at times.

**Are other albuminoids besides serumalbumin secreted from the urine at times ?**

Serumalbumin is the principal one, but globulin, albuminose, peptone, haemialbuminose, and mucine may also be present in urine under certain conditions.

**What changes may serumalbumin undergo in the urine ?**

It may be changed by alkalies into alkali-albumin and by stronger acids into acid-albumin, both of which are not coagulable on boiling ; if the urine is alkaline from ammonia or other alkalies it has to be neutralized and rendered slightly acid.

**Which are the two most reliable tests for detecting albumin in urine ?**

Boiling and the contact method with  $\text{HNO}_3$ .

**How is the boiling test performed?**

If urine is not acid render it so with a drop or two of acetic acid (if too much acid is added, uncoagulable acid-albumin is formed). Heat the upper portion of the urine in the test-tube, so as to have two strata for comparison, and if at or near the boiling-point a coagulum or turbidity results, albumin is present.

**What is the contact method (Heller's), and how applied?**

It is a ready and accurate method for bedside testing, and very reliable. Put a small quantity of urine into a test-tube, and, after inclining the latter, carefully pour in a little nitric acid so that there will be two distinct layers; if albumin is present there will be a cloudy zone between the acid and the urine.

**How may this reaction be simulated?**

If the patient has been taking copaiba, which, however, will become apparent by its odor.

**How may the quantity of albumin in urine be approximately expressed for clinical purposes?**

By the proportion of the bulk of precipitated albumin after standing for 24 hours to the total volume of the fluid employed, as, for instance,  $\frac{1}{4}$  or  $\frac{1}{5}$  albuminous layer, etc.

**How much albumin is usually in the urine of albuminuria, and what is the greatest amount that can be in it?**

It is rarely present in more than  $\frac{1}{10}-\frac{1}{2}$  per cent., but may rise to 1 and even 4 per cent.

**How is the quantity of albumin in the urine approximately determined with Esbach's albuminometer?**

By precipitating it with acidulated solution of picric acid in a graduated tube which indicates the relation of the volume of its precipitate to dry albumin, as follows: fill the tube to U with the urine and add picric acid solution to R, let stand for 24 hours, after which read off according to the graduation the amount of dry albumin contained in a liter of urine.

**What may give rise to the presence of albumin in urine?**

Renal disease, characterized by the presence of casts, also blood or pus from some part of the uropoetic apparatus.

**Are traces of albumin in urine always indicative of renal lesions?**

No, unless casts are also found.

**How are blood and pus best detected in the urine?**

By the characteristic appearance of their corpuscles under the microscope.

**How do albuminoids split up in peptic digestion?**

They are considered to contain a hemi- and anti-group, the former splitting up into antialbumose and antipeptone, the latter into hemialbumose and hemipeptone.

**What is peptone, and its destination?**

It is a soluble albuminoid, noncoagulable by heat or nitric acid, resulting in consequence of peptic digestion ; it is intended to be reconverted by the function of the liver into serumalbumin, if this is not accomplished it may circulate as such and be excreted by the kidneys without causing serious trouble to health. If it is excreted in large quantities it causes peptonuria, detected by overlaying Fehling's solution with urine, when a roseate color will appear on the line of contact.

**What is mucin?**

A substance resembling albuminoids, but containing no sulphur ; it is a product of the mucous membranes, precipitated by dilute  $HNO_3$  but not by strong. It is not coagulated by heat, soluble in alkalies, but precipitated by acids ; from urine containing it in solution it is precipitated best by acetic acid.

**Which are the principal globulins, and what do they form?**

The metaglobulin or fibrinogen and the paraglobulin or fibrinoplastin ; they form in the presence of fibrin ferment the coagulated albuminoid fibrin.

**What is fibrin?**

A white elastic substance, which separates from blood on standing but does not pre-exist as such in it.

**What is alkali albumin?**

A modification of albumin produced by the action of alkalies on solutions of albumin ; it is present in the blood, chyle, mus-

cles, etc.; it is uncoagulable by boiling and contains no sulphur.

### **What is acid albumin?**

Syntonin, albumose, or parapeptone; it is obtained when solutions of albumin are treated with acids, and is not coagulable by boiling.

### **What is casein?**

An albuminoid found in milk resembling alkali albumin but containing sulphur; it is not coagulated by boiling but precipitated from its solutions by rennet and acids.

### **What is gelatin, and how obtained?**

Gelatin is the collagen of white connective tissue; it is amorphous, translucent, yellowish, almost colorless and tasteless, swells up in cold and dissolves in hot water, cooling into a jelly. It is insoluble in alcohol and ether but soluble in glycerin; it is precipitated from its solutions by tannin but not by alum. It is obtained from bones, tendons, etc., the collagen of which is by boiling with water converted into gelatin.

## **Coloring Bodies.**

### **How may the soluble pigments of the body be regarded as forming?**

Originally from the blood coloring matter, hæmoglobin, changing to hæmatin and hæmotoidin, this to the biliary pigments bilirubin and biliverdin, while the hydrobilirubin of the faeces may be considered identical with the urobilin of the urine.

### **What is hæmoglobin?**

Hæmato-globulin, hæmato-crystallin, creturin, or erythroerourin, is a crystalline substance of complex composition containing all the elements of albumin plus iron.

### **Where is it found?**

In the red corpuscles of the blood.

### **Describe its properties.**

It is a crystalline solid, not diffusible, of red color, capable of

existing in two modifications, as oxyhaemoglobin and reduced haemoglobin or haemoglobin; the former being scarlet-red and the latter purplish. It is soluble in water and alkaline solutions, and insoluble in alcohol and ether.

**How can oxyhaemoglobin and reduced haemoglobin be distinguished?**

By the spectroscope; the absorption spectrum of the former exhibiting two bands, in D and E, while the latter shows one band between D and E.

**When and how do the changes in haemoglobin take place?**

The oxyhaemoglobin in the tissues gives off some of its oxygen, and forms haemoglobin, which in the lungs takes up oxygen, and again forms oxyhaemoglobin.

**What is the function of haemoglobin?**

To carry oxygen to the tissues.

**How is oxyhaemoglobin changed in watery solution?**

Into methaemoglobin, another modification, recognized by its absorption spectrum, which exhibits a band between C and D and two more, a larger and a smaller, between D and E.

**When haemoglobin is treated with dilute acids or alkalies what results?**

It is decomposed into globin or globulin and a ferruginous pigment haematin. This, according to its acid or alkaline state, gives two different spectra, of which the acid haematin exhibits two bands, one between C and D, and a larger one between D and E; the alkaline haematin exhibits one band only, between C and D and closer to the latter. Reduced haemoglobin treated as the former produces reduced haematin, recognized by two bands, one between D and E, and another to the right of E.

**What effect has carbon monoxide on haemoglobin?**

It produces carbonic oxide haemoglobin, recognized by exhibiting two bands in the spectrum similarly situated as those of oxyhaemoglobin, but the right is narrower than that of the latter. Carbonic oxide haemoglobin besides is a stable compound, and cannot be reduced as the oxy-modification.

## How can haemoglobin be recognized?

By the ozone test, which is applied by adding to the suspected liquid a few drops of fresh tincture of guaiacum, giving it a milky-white color; upon adding to this, and shaking it with a little old spirits of turpentine or ethereal solution of hydrogen peroxide, an indigo-blue color is developed if haemoglobin is present; this may be equally as well applied to dry-blood stains.

## Which is the best test for haemoglobin?

The haemin test. This consists of taking some of the suspected liquid, coagulating it by boiling with a drop of acetic acid ; the coagulum after drying is mixed in a minute proportion with a trifle of sodium chloride on a microscopic slide, a drop or two of glacial acid is then added, and it is brought to the boiling-point, when upon cooling there will be seen under the microscope characteristic purplish or brownish-red rhombic prisms or plates of haemin or haematin hydrochloride (Teichmann's crystals).

**Under what two conditions may haemoglobin appear in the urine?**

#### In hæmaturia and hæmoglobinuria.

## What is haematuria?

The pathological condition characterized by the presence of blood corpuscles in the urine.

## What is haemoglobinuria?

The pathological condition characterized by the presence of haemoglobin in solution in the urine without having corpuscular form.

## Hæmatoidin, what is it?

Yellow crystals occurring in old extravasations; its formula is  $C_{30}H_{34}N_4O_6$ , which makes it homologous with bilirubin, though they differ spectroscopically.

Which are the two principal biliary pigments?

### Bilirubin and biliverdin.

How is bilirubin supposed to be derived from haematin?

By combining with water as follows:—

**What is bilirubin ?**

The principal coloring matter of the bile.

**What is biliverdin ?**

A modification, or rather an oxidized product of bilirubin, forming spontaneously when alkaline solutions of bilirubin are exposed.

**How are the biliary pigments recognized ?**

By Gmelin's test.

**Describe Gmelin's test.**

Add nitric acid to the suspected liquid, and if biliary pigments are present a green precipitate will form, which, on addition of more acid, gives rise to a play of colors from green, blue, violet, and red to yellow ; this is best shown if a few drops of bile or liquor containing it and nitric acid are allowed to flow together on a porcelain plate when the colors will appear at the line of contact.

**Which is the principal urinary pigment ?**

Urobilin,  $C_{32}H_{44}N_4O_7$ , identical in composition with hydro-bilirubin, the modified biliary pigment in the faeces.

**What is the indican of the urine ?**

A yellowish pigment, sometimes called uroxanthin, contained in some urines ; with HCl it turns reddish-blue or blue from the formation of indigo ; chemically it is an indoxyl-potassium sulphate, and originates from the indol of the faeces.

**Which pigment gives urine the brownish-black color of certain pathological conditions ?**

Uromelanin, a black coloring body corresponding to the choroidal pigment and that of melanotic tumors.

# APPENDIX.

*Table of Elements.*

	Symbols.	Atomic valence.	Atomic weight.		Symbols.	Atomic valence.	Atomic weight.
Aluminium . . .	Al	iii	27	Nickel . . .	Ni	ii, iv	58.6

*Weights and Measures.*

## METRIC AND ENGLISH WEIGHTS.

1 milligram	= 0.001 gram.	= 0.015 gr. Troy.	1 grain Troy,	= 0.0648 gram.
1 centigram	= 0.01 "	= 0.154 "	1 drachm Troy,	= 3.888 grams.
1 decigram	= 0.1 "	= 1.543 "	1 ounce "	= 31.103 "
1 gram	=	= 15.434 grs.	1 " Br. P.	= 28.35 "
1 decagram	= 10 grams	= 154.34 "	1 " Avoird.	= 28.35 "
1 hectogram	= 100 "	= 3.53 ozs.	1 pound Troy, 12 oz.	= 373.242 "
1 kilogram	= 1000 "	= 35.27 "	1 " Avoird.	= 453.6 "

## METRIC AND ENGLISH MEASURES.

1 millimetre	= 0.001 metre	= 0.03937 inch.	1 inch	= 0.0254 metre.
1 centimetre	= 0.01 "	= 0.3937 "	1 foot	= 0.3048 "
1 decimetre	= 0.1 "	= 3.937 inches.	1 yard	= 0.9144 "
1 metre	=	= 39.3704 "	1 rod	= 5.0292 metres.
1 decametre	= 10 metres	= 32 ft. 9.7 "	1 furlong	= 201.1662 "
1 hectometre	= 100 "	= 328 " 1 inch.	1 mile	= 1609.3297 "
1 kilometre	= 1000 "	= 3280 " 10.4 inches.		

## METRIC AND APOTHECARIES' FLUID MEASURES.

1 millilitre, cubic centimetre or C. C.	= 0.001 litre	= 16.23 minimis.	1 minim	= 0.061 c. c.
1 centilitre	= 0.01 "	= 2.71 fluidrachms.	1 fluidrachm	= 3.7 "
1 decilitre	= 0.1 "	= 3.38 fluidounces.	1 fluidounce	= 29.6 "
1 litre	=	= 33.81 fluidounces.	1 pint	= 0.47 litre.
1 decalitre	= 10 litres	= 2.6417 gallons.	1 quart	= 0.946 "
1 hectolitre	= 100 "	= 26.417 "	1 gallon	= 3.785 litres.
1 kilolitre	= 1000 "	= 264.17 "		

RULES FOR CONVERTING APOTHECARIES' INTO METRIC  
WEIGHTS AND MEASURES APPROXIMATELY.

(According to Oldberg.)

1. To express quantities by weight of the Apothecaries' system in metric terms, or to write medical prescriptions in metric weights.

RULE A. Reduce each quantity to grains; then divide the number by 10 (or move the decimal point one place to the left), and from the quotient subtract one-third. The remainder is in each case the number of grams representing (nearly) the same quantity. Or,

RULE B. Reduce each quantity to drachms, and multiply the number by 4. The product is in each case the number of grams representing (nearly) the same quantity. Or,

RULE C. Reduce each quantity to ounces, and multiply the number by 32. The product is in each case the number of grams representing (nearly) the same quantity.

2. To express quantities by measure of the Apothecaries' system in metric terms, or to write medical prescriptions in metric cubic measures.

RULE D. Reduce each quantity to minims ; then divide the number by 10 (or move the decimal point one place to the left), and from the quotient subtract one-third. The remainder is in each case the number of cubic centimetres representing (nearly) the same quantity. Or,

RULE E. Reduce each quantity to fluidrachms, and multiply the number by 4. The product is in each case the number of cubic centimetres representing (nearly) the same quantity. Or,

RULE F. Reduce each quantity to fluidounces, and multiply the number by 32. The product is in each case the number of cubic centimetres representing (nearly) the same quantity.

RULES FOR CONVERTING CENTIGRADE INTO FAHRENHEIT.

(D to stand for the degree to be converted.)

If above the freezing point of water, 32° F. (0° C.),  $\frac{D}{5} \times 9 + 32$ .

If below freezing, but above 0° F. ( $-17.77^{\circ}$  C.),  $32 - \left( \frac{D}{5} \times 9 \right)$

If below 0° F. ( $-17.77^{\circ}$  C.)  $- \left( \frac{D}{5} \times 9 \right) - 32$ .

RULES FOR CONVERTING FAHRENHEIT INTO CENTIGRADE.

If above the freezing point of water, 32° F. (0° C.),  $\frac{(D-32)}{9} \times 5$ .

If below freezing, but above 0° F. ( $-17.77^{\circ}$  C.)  $- \frac{(32-D)}{9} \times 5$ .

If below 0° F. ( $-17.77^{\circ}$  C.)  $- \frac{(D+32)}{9} \times 5$ .

*Now Ready—Fourth Edition.*  
CONTAINING  
“HINTS ON DISSECTION.”

## Essentials of Anatomy and Manual of Practical Dissection.

BY CHARLES B. NANCREDE, M.D.,

Professor of Surgery and Clinical Surgery in the University of Michigan, Ann Arbor; Corresponding Member of the Royal Academy of Medicine, Rome, Italy; late Surgeon Jefferson Medical College, etc. etc.

With Handsome Full-page Lithographic Plates in Colors. Over 200 Illustrations.

No pains or expense has been spared to make this work the most exhaustive yet concise Student's Manual of Anatomy and Dissection ever published, either in this country or Europe.

The colored plates are designed to aid the student in dissecting the muscles, arteries, veins, and nerves. For this edition the woodcuts have all been specially drawn and engraved, and an Appendix added containing 60 illustrations representing the structure of the entire human skeleton, the whole based on the eleventh edition of Gray's Anatomy, and forming a handsome post 8vo volume of over 400 pages.

Price, Extra Cloth or Oilcloth for the Dissection-Room, \$2.00 Net.  
Medical Sheep, . . . . . 2.50 “

# Saunders' Question-Compends

*Arranged in the form of Questions and Answers.*

THE LATEST, CHEAPEST AND BEST ILLUSTRATED SERIES OF COMPENDS.

*New York Medical Record, AUGUST 23d, 1890:—*

"Where the work of preparing Students' Manuals is to end we cannot say, but the Saunders series, in our opinion, bears off the palm at present."

*University Medical Magazine:—* "Best of their class that have yet appeared."

*Southern California Practitioner:—*

"Mr. Saunders' series of Compends are the best ever published in this country."

*Now Ready.*

A MANUAL

OF

MEDICAL JURISPRUDENCE

AND

TOXICOLOGY.

BY

HENRY CHAPMAN, M.D.,

Professor of Institutes of Medicine and Medical Jurisprudence in the Jefferson Medical College of Philadelphia; Member of the College of Physicians of Philadelphia, of the Academy of Natural Sciences of Philadelphia, of the American Philosophical Society, and of the Zoological Society of Philadelphia.

232 pages. Post-octavo.

WITH THIRTY-SIX ILLUSTRATIONS,

Some of which are in Colors.

Price, \$1.25 Net.

For many years there has been a demand from members of the medical and legal professions for a medium-sized work on this most important branch of medicine. The necessarily prescribed limits of the work permit only the consideration of those parts of this extensive subject which the experience of the author as coroner's physician of the city of Philadelphia for a period of six years leads him to regard as the most material for practical purposes.

Particular attention is drawn to the illustrations, many being produced in colors, thus conveying to the layman a far clearer idea of the more intricate cases.

W. B. SAUNDERS, Publisher,  
925 Walnut St., Philadelphia, Pa.

**NOW READY.**

# **Notes on the Newer Remedies**

**THEIR**

## **THERAPEUTIC APPLICATIONS AND MODES OF ADMINISTRATION.**

**BY**

**DAVID CERNA, M.D., Ph.D.,**

Demonstrator of and Lecturer on Experimental Therapeutics in the University of Pennsylvania.

**FORMING A SMALL OCTAVO VOLUME OF ABOUT 175  
PAGES (7 x 5) INCHES.**

**PRICE, - \$1.25.**

The work will take up in alphabetical order all the Newer Remedies, giving their physical properties, solubility, therapeutic applications, administration, and chemical formula.

It will, in this way, form a very valuable addition to the various works on Therapeutics now in existence.

Chemists are so multiplying compounds that if each compound is to be thoroughly studied, investigations must be carried far enough to determine the practical importance of the new agents.

Brevity and conciseness compel the omission of all biographical references.

**W. B. SAUNDERS, Publisher,  
925 Walnut St., Philadelphia, Pa.**

IN PREPARATION.

---

METHODS  
OF  
PREVENTING AND CORRECTING  
DEFORMITIES OF THE BONES AND JOINTS.

A Handbook of Practical Orthopedic Surgery.

---

By H. AUGUSTUS WILSON, M.D.,

PROFESSOR OF GENERAL AND ORTHOPEDIC SURGERY, PHILADELPHIA POLY-  
CLINIC; CLINICAL PROFESSOR OF ORTHOPEDIC SURGERY, JEFFERSON  
MEDICAL COLLEGE, PHILADELPHIA, ETC., ETC.

The aim of the author will be to provide a book of moderate size containing comprehensive details that will enable general practitioners to thoroughly understand the mechanical features of the many forms of congenital and acquired deformities of the bones and joints.

Such a book might well be called Orthopedic Therapeutics, as it will adopt as a basis the description, symptoms, signs, and diagnosis upon which to elaborate the appropriate details of treatment.

The mechanical functions that are impaired will be considered first as to prevention, as of primary importance, and following this will be described the methods of correction that have been proved practical by the author. Operative procedures will be considered from a mechanical standpoint as well as surgically. Prominence will be given to the mechanical requirements for braces and artificial limbs, etc., with description of the methods for constructing the simplest forms, whether made of plaster of Paris, felt, leather, paper, steel, or other materials, together with the methods of readjustment to suit the changes occurring during the progress of the case.

An important feature of the book will be the practical application of remedial gymnastics and movements in the prevention or recovery of lost mechanical functions of the muscles when they have produced or tend to produce bone or joint deformities.

A very large number of original illustrations will be used to make descriptions clearer. The elimination of theoretical matters still in doubt will make the book one of practical value to busy physicians, from whom such cases generally receive first attention, and by whom they may be successfully treated.

NOW READY.

SECOND EDITION.

**AN OPERATION BLANK**  
WITH  
**Lists of Instruments, Etc.**  
REQUIRED IN  
**VARIOUS OPERATIONS.**

PREPARED BY  
**W. W. KEEN, M.D., LL.D.,**  
Professor of Principles of Surgery in the Jefferson Medical  
College of Philadelphia.

A convenient blank, suitable for all operations, giving complete instructions regarding necessary preparation of patient, etc., with a full list of dressings and medicines to be obtained from drug store.

At the back of pad is a list of instruments used —viz.: general instruments, etc. required for all operations, and special instruments for surgery of the brain and spine, mouth and throat, abdomen, rectum, male and female genito-urinary organs, the bones, etc., etc.

The whole forming a neat pad arranged for hanging on wall of surgeon's office or hospital operating-room.

Price per Pad, containing Blanks for 50 Operations,  
**50 CENTS, NET.**

**W. B. SAUNDERS, Publisher,**  
925 Walnut Street, Philadelphia.

**Southern California Practitioner, Jan. 1892.**

"Of its kind, the book has no equal. Its points of superiority may be enumerated as follows: Convenient size; diseases in alphabetical order, with blanks for additions at end of each letter; prescriptions and formulæ taken from the latest standard works, and containing the latest remedies. In the appendix the diet-table cannot but be of service to those who use the book."

**Indiana Medical Journal, Jan. 1892.**

"The Formulæ are all first class, and the book is gotten up in a style that is unexceptional. It is neatly bound and indexed with the 'Imperial Index,' the best devised for reference and neatness. We heartily commend it to all who need such a companion."

**Virginia Medical Monthly, Feb. 1892.**

"This 'Formulary' is arranged alphabetically as to diseases, under which headings 1734 appropriate prescriptions—well selected and carefully corrected—are given. The 'Appendix' contains many items of useful information, and will be found useful to the general practitioner as a ready reference reminder."

**Medical Brief Jan. 1892.**

"In compiling this work the author has introduced most of the recently discovered drugs in the prescriptions given, his ability in selecting those contained in this work shows him to be a man of rare judgment."

**New York Medical Record, February 27, 1892.**

"This little book, that can be conveniently carried in the pocket, contains an immense amount of material. It is very useful, and as the name of the author of each prescription is given, is unusually reliable."

**College and Clinical Record, Feb. 1892.**

"The best collection of Formulæ issued for a long time, being practical, modern, and aptly chosen."

**Southern Practitioner, Jan. 1892.**

"An excellent pocket companion, containing the most satisfactory and rational formulæ used by the leading medical men of Europe and America, introducing in the many prescriptions contained therein a considerable number of the more important recently-discovered drugs."

**American Gynaecological Journal, Jan. 1892.**

"The prescriptions are of great value to the physician, by giving him the latest treatment and combination of drugs to be employed in a given case, and enabling him to study the methods of combination in use by other practitioners."

**American Practitioner and News, Dec. 1891.**

"Cannot but be of service to the practitioner who desires to know what is going on in the therapeutic world. The formulæ are well selected, and embrace about everything prescribed and prescribable in the Materia Medica."

**Prescription, Feb. 1892.**

"A valuable little volume for the office-table: a considerable library would have to be hunted through to gather the information contained under this cover."

EDITED BY

WILLIAM W. KEEN, M.D., LL.D., AND  
J. WILLIAM WHITE, M.D., Ph.D.

The want of a text-book which could be used by the practitioner and at the same time be recommended to the medical student has been deeply felt, especially by teachers of surgery. Hence, when it was suggested to a number of them that it would be well to unite in preparing a book of this description, great unanimity of opinion was found to exist, and the gentlemen before named gladly consented to join in its production. While there is no distinctive American Surgery, yet America has contributed very largely to the progress of modern surgery, and among the foremost of those who have aided in developing this art and science will be found the authors of the present volume. All of them are teachers of surgery in leading medical schools and hospitals in the United States and Canada.

Especial prominence has been given to Surgical Bacteriology; a feature which is believed to be unique in a surgical text-book in the English language. Asepsis and Antisepsis have received particular attention, and full details of the various methods of disinfecting instruments, hands, and the field of operations, sutures, etc., will be found. The text is brought well up to date in such important branches as cerebral, spinal, intestinal, and pelvic surgery, and the most important and newest operations in these departments are described and illustrated.

The text of the entire book has been submitted to all the authors for their mutual criticism and revision, also an entirely new and original feature in book-making. The book, as a whole, therefore, expresses on all the important surgical topics of the day the consensus of opinion of the eminent surgeons who have joined in its preparation.

One of the most attractive features of the book is its illustrations. Very many of them are original and faithful reproductions of photographs taken directly from patients or from specimens, and the modern improvements in the art of engraving have enabled the publishers to produce illustrations which it is believed are superior to those in any similar work.

A TREATISE

ON THE

Theory and Practice of Medicine.

BY

AMERICAN TEACHERS.

EDITED BY WILLIAM PEPPER, M.D., LL.D.,  
Provost and Professor of the Theory and Practice of Medicine and of Clinical  
Medicine in the University of Pennsylvania.

To be Completed in Two Handsome Royal Octavo Volumes of about  
1000 pages each, with Illustrations to Elucidate  
the Text wherever Necessary.

Price per vol., Cloth, \$5 net; Sheep, 96 net; Half Russia, \$7 net.

**VOLUME I. (Now Ready) contains:**

**Hygiene.**

J. S. BILLINGS, Professor of Hygiene, University of Pennsylvania.

**Fevers, (Ephemeral, Simple Continued, Typhus, Typhoid, Epidemic  
Cerebro-spinal Meningitis, and Relapsing.)**

WM. PEPPER, M.D., Provost and Professor of the Theory and Practice  
of Medicine and of Clinical Medicine, University of Pennsylvania.

**Scarlatina, Measles, Rotheln, Variola, Varioloid, Vaccinia, Varicella,  
Mumps, Whooping-cough, Anthrax, Hydrophobia, Trichinosis,  
Actinomycosis, Glanders, and Tetanus.**

JAMES T. WHITTAKER, M.D., Professor of the Theory and Practice of  
Medicine and of Clinical Medicine, Medical College of Cincinnati, O.

**Tuberculosis, Scrofula, Syphilis, Diphtheria, Erysipelas, Malaria,  
Cholera, and Yellow Fever.**

W. GILMAN THOMPSON, M.D., Professor of Physiology, New York  
University Medical College.

**Nervous, Muscular, and Mental Diseases (Including Opium Habit, etc.).**

HORATIO C. WOOD, M.D., Professor of Materia Medica, Pharmacy, and  
General Therapeutics, and Clinical Professor of Nervous Diseases,  
University of Pennsylvania. And

WILLIAM OSLER, M.D., Professor of Practice of Medicine, Johns Hop-  
kins University, Baltimore, Md.

## **VOLUME II. (Ready Shortly) will contain:**

### **Urine (Chemistry and Microscopy).**

**JAMES W. HOLLAND, M.D., Professor of Medical Chemistry and Toxicology, Jefferson Medical College, Philadelphia.**

### **Kidneys and Lungs.**

**FRANCIS DELAFIELD, M.D., Professor of Pathology and Practice of Medicine, College of Physicians and Surgeons, New York City.**

### **Air-passages (Larynx and Bronchi) and Pleura.**

**JAMES C. WILSON, M.D., Professor of Practice of Medicine and of Clinical Medicine, Jefferson Medical College, Philadelphia.**

### **Pharynx, Oesophagus, Stomach, and Intestines (Including Intestinal Parasites).**

**WILLIAM PEPPER, M.D., Provost and Professor of the Theory and Practice of Medicine and of Clinical Medicine, University of Pennsylvania.**

### **Peritoneum, Liver, and Pancreas.**

**REGINALD H. FITZ, M.D., Hersey Professor of Physics, Harvard Medical School.**

### **Diathetic Diseases (Rheumatism, Rheumatoid Arthritis, Gout, Lithæmia, and Diabetes).**

**HENRY M. LYMAN, M.D., Professor of Principles and Practice of Medicine, Rush Medical College, Chicago, Ill.**

### **Heart, Aorta, Arteries, and Veins.**

**E. G. JANEWAY, M.D., Professor of Principles and Practice of Medicine, Bellevue Hospital Medical College, New York City.**

### **Blood and Spleen.**

**WILLIAM OSLER, M.D., Professor of Practice of Medicine, Johns Hopkins University, Baltimore, Md.**

### **Inflammation, Embolism, Thrombosis, Fever, and Bacteriology.**

**W. H. WELCH, M.D., Professor of Pathology, Johns Hopkins University, Baltimore, Md.**

---

The articles are not written as though addressed to students in lectures, but are exhaustive descriptions of diseases with the newest facts as regards Causation, Symptomatology, Diagnosis, Prognosis, and Treatment, and will include a large number of approved Formulae. The recent advances made in the study of the bacterial origin of various diseases are fully described, as well as the bearing of the knowledge so gained upon prevention and cure. The subjects of Bacteriology as a whole and of immunity are fully considered in a separate section.

Methods of diagnosis are given the most minute and careful attention, thus enabling the reader to learn the very latest methods of investigation without consulting works specially devoted to the subject.

IN PREPARATION.

AN AMERICAN TEXT-BOOK  
OF THE  
DISEASES OF CHILDREN.  
INCLUDING

Special Chapters on Essential Surgical Subjects; Diseases of the Eye, Ear, Nose, and Throat; Diseases of the Skin; and on the Diet, Hygiene, and General Management of Children.

BY  
AMERICAN TEACHERS.

EDITED BY  
LOUIS STARR, M.D.,

ASSISTED BY  
THOMPSON S. WESTCOTT, M.D.

---

Forming a handsome imperial 8vo. vol. of about 1000 pages, profusely illustrated.

PHILADELPHIA:  
W. B. SAUNDERS,  
913 WALNUT STREET.

## ANNOUNCEMENT.

An American Text-book of the Diseases of Children will be issued as a handsome imperial octavo volume of about 1000 pages, uniform with an American Text-book of Surgery, containing numerous wood-cuts, half-tone plates, and colored illustrations. The plan contemplates a series of original articles written by some sixty well-known paediatricians, representing collectively the present teachings of the most prominent medical schools and colleges of America. The work is not intended to be encyclopaedic in character, but to be a practical book suitable for constant and handy reference by the practitioner and advanced student.

One decided innovation for a book of its size is the large number of authors, nearly every article being contributed by a specialist in the line on which he writes. This, while entailing considerable labor upon the editors, has resulted in the publication of a work thoroughly new and abreast of the times. The entire work has been practically written in a few months, thus removing the usual objection to treatises of this class, that they are out of date before they are published.

Especial attention is given to the consideration of the latest accepted teaching upon the Etiology, Symptoms, Pathology, Diagnosis, and Treatment of the disorders of children, with the introduction of many special formulae and therapeutic procedures.

Special chapters embrace at unusual length the diseases of the Eye, Ear, Nose and Throat, and the Skin; while the introductory chapters cover fully the important subjects of Diet, Hygiene, Exercise, Bathing, and the Chemistry of Food. Tracheotomy, Intubation, Circumcision, and such minor surgical procedures coming within the province of the medical practitioner are carefully considered.

For Sale by Subscription only.  
Now Ready—Second Revised Edition.

# MEDICAL DIAGNOSIS.

By DR. OSWALD VIERORDT,

Professor of Medicine at the University of Heidelberg; formerly Privat Docent  
at University of Leipzig; Professor of Medicine and Director  
of the Medical Polyclinic at the Univ. of Jena.

Translated with additions, from the Second Enlarged German Edition,  
with the Author's Permission.

By FRANCIS H. STUART, A.M., M.D.,

Member of the Medical Society of the County of Kings, N. Y.; Fellow of the  
New York Academy of Medicine; Member of the  
British Medical Association, etc.

In One Handsome Royal Octavo Volume of 700 Pages.

178 Fine Wood-cuts in Text, Many of Which are in Colors.

**Price, Cloth, \$4 net; Sheep, \$5 net; Half Russia, \$5.50 net.**

This Valuable Work is now Published in German, English, Russian, and Italian.

FIRST AMERICAN EDITION EXHAUSTED WITHIN SIX MONTHS.

## PROFESSIONAL OPINIONS.

"One of the most valuable and useful works in medical literature."

(Signed)      ALEXANDER J. C. SKENE, M.D.,  
*Dean of the Long Island College Hospital, and Professor of the  
Medical and Surgical Diseases of Women.*

"Indispensable to both 'students and practitioners.'"

(Signed)      F. MINOT, M.D.,  
*Harvey Professor of Theory and Practice of Medicine, Harvard University.*

"It is very well arranged and very complete, and contains valuable features  
not usually found in the ordinary books."

(Signed)      J. H. MUSSER, M.D.,  
*Assistant Professor Clinical Medicine, University of Pennsylvania.*

"A most excellent book upon a most important subject."

(Signed)      J. S. CAIN, M.D.,  
*Professor of Practice of Medicine and General Pathology,  
Nashville Medical College, Nashville, Tenn.*

"One of the most valuable works now before the profession, both for study and  
reference."

(Signed)      N. S. DAVIS, M.D.,  
*Professor of Principles and Practice of Medicine and  
Clinical Medicine, Chicago Medical College.*

"A treasury of practical information which will be found of daily use to every  
busy practitioner who will consult it."

(Signed)      C. A. LINDSLEY, M.D.,  
*Professor of Theory and Practice of Medicine, Yale University, New Haven, Conn.*

**For Sale by Subscription only.**

**NOW READY.**

# DISEASES OF THE EYE.

A Hand-Book of Ophthalmic Practice.

By G. E. DE SCHWEINITZ, M.D.,

Professor of Diseases of the Eye, Philadelphia Polyclinic; Professor of Clinical Ophthalmology, Jefferson Medical College, Philadelphia; Ophthalmic Surgeon to Children's Hospital and to the Philadelphia Hospital; Ophthalmologist to the Orthopaedic Hospital and Infirmary for Nervous Diseases; late Lecturer on Medical Ophthalmoscopy, University of Pa., etc.

Forming a handsome royal 8vo. vol. of more than 600 pages.

Over 200 fine wood-cuts, many of which are original, and two chromo-lithographic plates.

Price, Cloth, \$4 net; Sheep, \$5 net; Half Russia, \$5.50 net.

## PROFESSIONAL OPINIONS.

"A work that will meet with the requirements not only of the specialist, but of the general practitioner in a rare degree. I am satisfied that unusual success awaits it."

(Signed) WILLIAM PEPPER, M.D.,

*Provost and Professor of Theory and Practice of Medicine and Clinical Medicine in the University of Pennsylvania.*

"Contains in concise and reliable form the accepted views of Ophthalmic Science."

(Signed) WILLIAM THOMSON, M.D.,

*Professor of Ophthalmology, Jefferson Medical College, Philadelphia, Pa.*

"One of the best hand-books now extant on the subject."

(Signed) J. O. STILLSON, M.D.,

*Professor of Eye and Ear, Central College of Physicians and Surgeons, Indianapolis, Ind.*

"Vastly superior to any book on the subject with which I am familiar."

(Signed) FRANCIS HART STUART, M.D.,

*Brooklyn, N. Y.*

"Contains in the most attractive and easily understood form just the sort of knowledge which is necessary to the intelligent practice of general medicine and surgery."

(Signed) J. WILLIAM WHITE, M.D.,

*Professor of Clinical Surgery in the University of Pennsylvania.*

"A very reliable guide to the study of eye diseases, presenting the latest facts and newest ideas."

(Signed) SWAN M. BURNETT, M.D.,

*Prof. of Ophthalmology and Otolaryngology, Med. Department Univ. Georgetown, Washington, D. C.*

*For Sale by Subscription only.*

# A NEW PRONOUNCING DICTIONARY OF MEDICINE.

WITH

Phonetic Pronunciation, Accentuation, Etymology, etc.

BY JOHN M. KEATING, M.D., LL.D.,

Fellow of the College of Physicians of Philadelphia; Vice-President of the American Paediatric Society; Ex-President of the Association of Life Insurance Medical Directors; Editor "Cyclopaedia of the Diseases of Children," etc.;

AND

HENRY HAMILTON,

Author of "A new Translation of Virgil's Æneid into English Rhyme;"  
Co-Author of "Saunders' Medical Lexicon," etc.

## WITH AN APPENDIX

CONTAINING IMPORTANT TABLES OF BACILLI, MICROCOCCI, LEUCOMAÏNES,  
PTOMAÏNES; DRUGS AND MATERIALS USED IN ANTISEPTIC SURGERY;  
POISONS AND THEIR ANTIDOTES; WEIGHTS AND MEASURES;  
THERMOMETRIC SCALES; NEW OFFICINAL AND  
UNOFFICINAL DRUGS, ETC. ETC.

Forming One very Attractive Volume of over 800 pages.

Price, Cloth, \$5 net; Sheep, \$6 net; Half Russia, \$6.50 net.

With Denison's Patent Index for Ready Reference.

"I am much pleased with Keating's Dictionary, and shall take pleasure in recommending it to my classes." (Signed) HENRY M. LYMAN, M.D.,  
*Professor of Principles and Practice of Medicine, Rush Medical College, Chicago, Ill.*

"I am convinced that it will be a very valuable adjunct to my study table, convenient in size and sufficiently full for ordinary use." (Signed) C. A. LINDSLEY, M.D.,

*Professor of Theory and Practice of Medicine, Medical Dept. Yale University,  
Secretary Connecticut State Board of Health, New Haven, Connecticut.*

"I will point out to my classes the many good features of this book as compared with others, which will, I am sure, make it very popular with students." (Signed) JOHN CRONYN, M.D., LL.D.,

*Professor of Principles and Practice of Medicine and Clinical Medicin;  
President of the Faculty, Medical Dept. Niagara University, Buffalo, N. Y.*

"My examination and use of it have given me a very favorable opinion of its merit, and it will give me pleasure to recommend its use to my class." (Signed) J. W. H. LOVEJOY, M.D.,

*Professor of Theory and Practice of Medicine, and President of the Faculty,  
Medical Dept. Georgetown University, Washington, D. C.*

Second Edition, for Sale by Subscription.

# AUTOBIOGRAPHY OF SAMUEL D. GROSS, M.D.,

D. C. L. OXON., LL.D. CANTAB., EDIN., JEFFERSON COLLEGE, UNIV. PA.,  
EMERITUS PROFESSOR OF SURGERY IN THE JEFFERSON MEDICAL  
COLLEGE OF PHILADELPHIA.

WITH REMINISCENCES OF  
HIS TIMES AND CONTEMPORARIES.

Edited by his Sons, SAMUEL W. GROSS, M.D., LL.D., late Professor of Principles of Surgery and of Clinical Surgery in the Jefferson Medical College, and A. HALLER GROSS, A.M., of the Philadelphia Bar.

*Preceded by a Memoir of Dr. Gross by the late Austin Flint, M.D., LL.D.*

In two handsome vols., each containing over 400 pages, demy 8vo., ex. cloth, gt. tops, with fine Frontispiece engraved on steel.

**Price . . . \$5.00 net.**

This AUTOBIOGRAPHY, which was continued by the late eminent Surgeon until within three months before his death, contains a full and accurate history of his early struggles, trials, and subsequent successes, told in a singularly interesting and charming manner, and embraces short and graphic pen portraits of many of the most distinguished men—surgeons, physicians, divines, lawyers, statesmen, scientists, etc. etc.—with whom he was brought in contact in this country and in Europe; the whole forming a retrospect of more than three-quarters of a century.

# SAUNDERS' Pocket Medical Formulary

BY

WILLIAM M. POWELL, M.D.,

Attending Physician to the Mercer House for Invalid Women, at Atlantic City.

CONTAINING

1750 Formulæ, selected from several hundreds of the best known  
authorities.

Forming a handsome and convenient Pocket Companion of nearly 300  
printed pages, and blank leaves for additions.

## WITH AN APPENDIX

Containing Posological Table; Formulæ and Doses for Hypodermic Medication; Poisons and their Antidotes; Diameters of the Female Pelvis and Fœtal Head; Obstetrical Table; Diet List for various diseases; Materials and Drugs used in Antiseptic Surgery; Treatment of Asphyxia from Drowning; Surgical Remembrancer; Tables of Incompatibles; Eruptive Fevers; Weights and Measures, etc.

Second Edition, Revised and greatly Enlarged.

Handsomely bound in Morocco, with Patent Index, Wallet, and Flap.

**Price, \$1.75. net.**

THERAPEUTIC GAZETTE, January, 1892.—“The prescriptions have been taken from the writings or practice of Physicians whose experience qualifies them to be worthy of trial. We heartily recommend this volume to all who desire to purchase such a work.”

NEW YORK MEDICAL RECORD, February 27, 1892.—“This little book, that can be conveniently carried in the pocket, contains an immense amount of material. It is very useful, and, as the name of the author of each prescription is given, is unusually reliable.”

# SAUNDERS' SERIES OF MANUALS

FOR

## Students and Practitioners.

---

The aim of the Publisher is to furnish, in this Series of Manuals, a number of high-class works by prominent teachers who are connected with the principal Colleges and Universities of this country; the position and experience of each being a guarantee of the soundness and standard of text of the subject on which he writes.

Especial care has been exercised in the choice of large, clear, readable type; a high grade of slightly toned paper, of a shade particularly adapted for reading by artificial light; high class illustrations, printed in colors when necessary to a clear elucidation of the text; and strong, attractive, and uniform bindings.

The prices vary greatly (\$1.00 to \$2.50), it not being considered desirable to fix an arbitrary standard and pad the volumes accordingly.

*Now Ready—Fourth Edition.*  
CONTAINING  
“HINTS ON DISSECTION.”

## Essentials of Anatomy and Manual of Practical Dissection.

BY CHARLES B. NANCREDE, M.D.,

Professor of Surgery and Clinical Surgery in the University of Michigan, Ann Arbor; Corresponding Member of the Royal Academy of Medicine, Rome, Italy; late Surgeon Jefferson Medical College, etc. etc.

With Handsome Full-page Lithographic Plates in Colors. Over 200 Illustrations.

No pains or expense has been spared to make this work the most exhaustive yet concise Student's Manual of Anatomy and Dissection ever published, either in this country or Europe.

The colored plates are designed to aid the student in dissecting the muscles, arteries, veins, and nerves. For this edition the woodcuts have all been specially drawn and engraved, and an Appendix added containing 60 illustrations representing the structure of the entire human skeleton, the whole based on the eleventh edition of Gray's Anatomy, and forming a handsome post 8vo volume of over 400 pages.

Price, Extra Cloth or Oilcloth for the Dissection-Room, \$2.00 Net.  
Medical Sheep, . . . . . 2.50 “

A MANUAL  
OF  
MEDICAL JURISPRUDENCE  
AND  
TOXICOLOGY.

BY

HENRY CHAPMAN, M.D.,

Professor of Institutes of Medicine and Medical Jurisprudence in the Jefferson Medical College of Philadelphia; Member of the College of Physicians of Philadelphia, of the Academy of Natural Sciences of Philadelphia, of the American Philosophical Society, and of the Zoological Society of Philadelphia.

232 pages. Post-octavo.

WITH THIRTY-SIX ILLUSTRATIONS,

Some of which are in Colors.

Price, \$1.25 Net.

For many years there has been a demand from members of the medical and legal professions for a medium-sized work on this most important branch of medicine. The necessarily prescribed limits of the work permit only the consideration of those parts of this extensive subject which the experience of the author as coroner's physician of the city of Philadelphia for a period of six years leads him to regard as the most material for practical purposes.  
Particular attention is drawn to the illustrations, many being produced in colors, thus conveying to the layman a far clearer idea of the more intricate cases.

The following Manuals now preparing will be Issued Shortly.

---

# Nursing: Its Principles and Practice FOR HOSPITAL AND PRIVATE USE.

BY ISABEL ADAMS HAMPTON,

Graduate of the New York Training School for Nurses attached to Bellevue Hospital; Superintendent of Nurses and Principal of the Training School for Nurses, Johns Hopkins Hospital, Baltimore, Md.; Late Superintendent of Nurses, Illinois Training School for Nurses, Chicago, Illinois.

**Price, \$2.00 net.**

This book will outline a definite, systematic course of teaching for pupil-nurses with a thoroughness that nothing previously published on the subject has attempted; and the need for such a work is greatly felt by young superintendents when taking upon themselves the responsibility of training-school work.

Thoroughly tested and most approved processes are given in all the details of practical nursing, particularly in antiseptic surgery, and the minutest details regarding the nurse's technique have been explained.

The methods used in Johns Hopkins Hospital have in all cases been noted as the authority.

---

# A SYLLABUS OF LECTURES ON THE PRACTICE OF SURGERY. ARRANGED IN CONFORMITY WITH THE AMERICAN TEXT-BOOK OF SURGERY.

BY NICHOLAS SENN, M.D., PH.D.,

Professor of Surgery in Rush Medical College, Chicago, and in the Chicago Polyclinic.

# A MANUAL OF Materia Medica and Therapeutics.

BY A. A. STEVENS, A.M., M.D.,

Instructor of Physical Diagnosis in the University of Pennsylvania and Demonstrator of Pathology in the Woman's Medical College of Philadelphia.

# A MANUAL OF SURGERY—General and Operative.

BY JOHN CHALMERS DA COSTA, M.D.

**NOW READY.**

---

# Notes on the Newer Remedies

THEIR

THERAPEUTIC APPLICATIONS  
AND MODES OF ADMINISTRATION.

BY

DAVID CERNA, M.D., Ph.D.,

Demonstrator of and Lecturer on Experimental Therapeutics in the  
University of Pennsylvania.

**FORMING A SMALL OCTAVO VOLUME OF ABOUT 175  
PAGES (7 x 5) INCHES.**

**PRICE, - \$1.25.**

The work will take up in alphabetical order all the Newer Remedies, giving their physical properties, solubility, therapeutic applications, administration, and chemical formula.

It will, in this way, form a very valuable addition to the various works on Therapeutics now in existence.

Chemists are so multiplying compounds that if each compound is to be thoroughly studied, investigations must be carried far enough to determine the practical importance of the new agents.

Brevity and conciseness compel the omission of all biographical references.

IN PREPARATION.

# DISEASES OF WOMEN.

BY HENRY J. GARRIGUES, A.M., M.D.,

Professor of Obstetrics in the New York Post-Graduate Medical School and Hospital; Gynaecologist to St. Mark's Hospital in New York City; Gynaecologist to the German Dispensary in the City of New York; Consulting Obstetrician to the New York Infant Asylum; Obstetric Surgeon to the New York Maternity Hospital; Fellow of the American Gynaecological Society; Fellow of the New York Academy of Medicine; President of the German Medical Society of the City of New York, etc. etc.

It is the intention of the writer to provide a practical work on Gynaecology, for the use of students and practitioners, in as concise a manner as is compatible with clearness.

## Syllabus of Obstetrical Lectures

In the Medical Department, University of Pennsylvania.

BY RICHARD C. NORRIS, A.M., M.D.,

DEMONSTRATOR ON OBSTETRICS IN THE UNIVERSITY OF PENNSYLVANIA.

Second Edition thoroughly revised and enlarged.

Price, Cloth, Interleaved for Notes . . . \$2.00 Net.

The New York *Medical Record* of April 19, 1890, referring to this book, says: "This modest little work is so far superior to others on the same subject that we take pleasure in calling attention briefly to its excellent features. Small as it is, it covers the subject thoroughly, and will prove invaluable to both the student and the practitioner as a means of fixing in a clear and concise form the knowledge derived from a perusal of the larger text-books. The author deserves great credit for the manner in which he has performed his work. He has introduced a number of valuable hints which would only occur to one who was himself an experienced teacher of obstetrics. The subject-matter is clear, forcible, and modern. We are especially pleased with the portion devoted to the practical duties of the accoucheur, care of the child, etc. The paragraphs on antiseptics are admirable; there is no doubtful tone in the directions given. No details are regarded as unimportant; no minor matters omitted. We venture to say that even the old practitioner will find useful hints in this direction which he cannot afford to despise."

# SAUNDERS' POCKET MEDICAL LEXICON;

OR,

*Dictionary of Terms and Words used in Medicine and Surgery.*

BY JOHN M. KEATING, M. D.,

Editor of "Cyclopaedia of Diseases of Children," etc.: Author of the  
"New Pronouncing Dictionary of Medicine,"

AND

HENRY HAMILTON,

Author of "A New Translation of Virgil's *Aeneid* into English Verse;"  
Co-author of a "New Pronouncing Dictionary of Medicine."

---

Price, 75 Cents, Cloth. \$1.00, Leather Tucks.

---

This new and comprehensive work of reference is the outcome of a demand for a more modern handbook of its class than those at present on the market, which, dating as they do from 1855 to 1884, are of but trifling use to the student by their not containing the hundreds of new words now used in current literature, especially those relating to Electricity and Bacteriology.

*Annals of Gynaecology,  
Philadelphia.*

Saunders' Pocket Medical Lexicon—a very complete little work, invaluable to every student of medicine. It not only contains a very large number of words, but also tables of etymological factors common in medical terminology; abbreviations used in medicine, poisons and antidotes, etc.

(From Appendix to Medical Lexicon.)

# SAUNDERS' QUESTION COMPENDS.

Now the Standard Authorities in Medical Literature

WITH

Students and Practitioners in every City of the United States  
and Canada.

## THE REASON WHY!

They are the advance guard of "Student's Helps"—that DO HELP; they are the leaders in their special line, *well and authoritatively written by able men, who, as teachers in the large colleges, know exactly what is wanted by a student preparing for his examinations.* The judgment exercised in the selection of authors is fully demonstrated by their professional elevation. CHOSEN FROM THE RANKS OF DEMONSTRATORS, QUIZ-MASTERS, AND ASSISTANTS, MOST OF THEM HAVE BECOME PROFESSORS AND LECTURERS IN THEIR RESPECTIVE COLLEGES.

Each book is of convenient size (5 by 7 inches), containing on an average 250 pages, profusely illustrated and elegantly printed in clear, readable type, on fine paper.

The entire series, numbering twenty-three subjects, has been kept thoroughly revised and enlarged when necessary, many of them being in their third and fourth editions.

## TO SUM UP.

Although there are numerous other Quizzes, Manuals, Aids, etc., in the market, none of them approach the "Blue Series of Question Compends," and the claim is made for the following points of excellence:—

1. Professional standing and reputation of authors.
2. Conciseness, clearness, and standard of text.
2. Size of type, quality of paper and binding.

No. 1.

# ESSENTIALS OF PHYSIOLOGY.

BY

H. A. HARE, M.D.,

Professor of Therapeutics and Materica Medica in the Jefferson Medical College of Philadelphia; Physician to St. Agnes' Hospital and to the Medical Dispensary of the Children's Hospital; Laureate of the Royal Academy of Medicine in Belgium, of the Medical Society of London, etc.; Secretary of the Convention for the Revision of the Pharmacopœia, 1890.

Crown 8vo., 280 pages, numerous illustrations.

Third Edition, revised and enlarged by the addition of a series of handsome plate illustrations taken from the celebrated "Icones Nervorum Capitis" of Arnold.

Price, Cloth, \$1.00 net. Interleaved for notes, \$1.25 net.

Specimen of Illustrations.

*University Medical Magazine,*

"Dr. Hare has admirably succeeded in gathering together a series of Questions which are clearly put and tersely answered."

*Pacific Medical Journal,*

"Hare's Physiology contains the essences of its subject. No better book has ever been produced, and every student would do well to possess a copy."

*Times and Register, Philadelphia,*

"In the second edition of Hare's Physiology all the more difficult points of the study of the nervous system have been elucidated. As the work now appears it cannot fail to merit the appreciation of the overworked student."

No. 2.

# ESSENTIALS OF SURGERY.

CONTAINING, ALSO,

Venereal Diseases, Surgical Landmarks, Minor and Operative Surgery, and a Complete Description, together with full Illustrations, of the Handkerchief and Roller Bandage.

BY EDWARD MARTIN, A.M., M.D.,

Clinical Professor of Genito-Urinary Diseases, Instructor in Operative Surgery, and Lecturer on Minor Surgery, University of Pennsylvania; Surgeon to the Howard Hospital; Assistant Surgeon to the University Hospital, etc. etc.

Fourth edition. Crown 8vo., 334 pages, profusely illustrated.

Considerably enlarged by an Appendix containing full directions and prescriptions for the preparation of the various materials used in ANTISEPTIC SURGERY; also several hundred recipes covering the medical treatment of surgical affections.

Price, Cloth, \$1.00. Interleaved for Notes, \$1.25.

*Medical and Surgical Reporter,*

"Martin's Surgery contains all necessary essentials of modern surgery in a comparatively small space. Its style is interesting and its illustrations admirable."

*University Medical Magazine,*

"Dr. Martin has admirably succeeded in selecting and retaining just what is necessary for purposes of examination, and putting it in most excellent shape for reference and memorizing."

*Kansas City Medical Record.*— "Martin's Surgery.—This admirable compend is well up in the most advanced ideas of modern surgery."

Specimen of Illustrations.

No. 3.

# ESSENTIALS OF ANATOMY,

Including the Anatomy of the Viscera.

By CHARLES B. NANCREDE, M.D.,

Professor of Surgery and Clinical Surgery in the University of Michigan

Ann Arbor; Corresponding Member of the Royal Academy of

Medicine, Rome, Italy; Late Surgeon Jefferson

Medical College, etc. etc.

Fourth edition. Crown 8vo., 380 pages, 180 illustrations.

Enlarged by an Appendix containing over Sixty Illustrations of  
the Osteology of the Human Body.

The whole based upon the last (eleventh) edition of  
GRAY'S ANATOMY.

Price, Cloth, \$1.00. Interleaved for Notes, \$1.25.

Specimen of Illustrations.

*American Practitioner and News,*

"Nancrede's Anatomy.—For self-quizzing and keeping fresh in mind the knowledge of Anatomy gains at school, it would not be easy to speak of it in terms too favorable."

*Southern Californian Practitioner,*

"Nancrede's Anatomy.—Very accurate and trustworthy."

*American Practitioner and News, Louisville, Kentucky.*

"Nancrede's Anatomy.—Truly such a book as no student can afford to be without."

No. 4.

# Essentials of Medical Chemistry

ORGANIC AND INORGANIC.

CONTAINING, ALSO,

Questions on Medical Physics, Chemical Physiology,  
Analytical Processes, Urinalysis, and Toxicology.

BY

LAWRENCE WOLFF, M.D.,

Demonstrator of Chemistry, Jefferson Medical College; Visiting Physician  
to German Hospital of Philadelphia; Member of Philadelphia  
College of Pharmacy, etc. etc.

THIRD AND REVISED EDITION, WITH AN APPENDIX.

Crown 8vo., 212 pages.

Price, Cloth, \$1.00. Interleaved for Notes, \$1.25.

*Cincinnati Medical News,*  
work that can be carried in the pocket, for ready reference in solving difficult  
problems."

*St. Joseph's Medical Herald,*  
simply the knotty and difficult points in chemistry, and the book is therefore  
well suited for use in medical schools."

*Medical and Surgical Reporter.*  
more books like this would be written, in order that medical students might  
thus early become more interested in what is often a difficult and uninteresting  
branch of medical study."

*Registered Pharmacist, Chicago.*  
—“The author is thoroughly familiar with his subjects. A useful addition to  
the medical and pharmaceutical library.”

“Wolff’s Chemistry.—A little

“Dr. Wolff explains most

“We could wish that

“Wolff’s Chemistry.”

No. 5.

# ESSENTIALS OF OBSTETRICS.

By W. EASTERLY ASHTON, M.D.,

Professor of Gynaecology in the Medico-Chirurgical College of Philadelphia;  
Obstetrician to the Philadelphia Hospital.

Third Edition, thoroughly revised and Enlarged

Crown 8vo., 244 pages, 75 illustrations.

Price, Cloth, \$1.00. Interleaved for Notes, \$1.25.

Specimen of Illustrations.

*Southern Practitioner,*  
little volume containing correct and practical knowledge. An admirable com-

pend, and the best condensation we have seen."

*Chicago Medical Times.*—“Ashton’s Obstetrics.—Of extreme value to stu-  
dents, and an excellent little book to freshen up the memory of the practi-  
tioner.”

*Medical and Surgical Reporter.* “Ashton’s Obstetrics.  
—A work thoroughly calculated to be of service to students in preparing for  
examination.”

*New York Medical Abstract.* “Ashton’s Obstetrics should be  
consulted by the medical student until he can answer every question at sight.  
The practitioner would also do well to glance at the book now and then, to  
prevent his knowledge from getting rusty.”

No. 6.

# ESSENTIALS

OF

## Pathology and Morbid Anatomy.

BY

C. E. ARMAND SEMPLE, B.A., M.B., Cantab., L.S.A., M.R.C.P., Lond.,

Physician to the Northeastern Hospital for Children, Harkney; Professor of Vocal and Aural Physiology and Examiner in Acoustics at Trinity College, London, etc. etc.

Crown 8vo., illustrated, 174 pages.

**Price, Cloth, \$1.00. Interleaved for Notes, \$1.25.**

From the *College and Clinical Record*,  
“A small work upon Pathology and Morbid Anatomy, that reduces such complex subjects to the ready comprehension of the student and practitioner, is a very acceptable addition to medical literature. All the more modern topics, such as Bacteria and Bacilli, and the most recent views as to Urinary Pathology, find a place here, and in the hands of a writer and teacher skilled in the art of simplifying abstruse and difficult subjects for easy comprehension are rendered thoroughly intelligible. Few physicians do more than refer to the more elaborate works for passing information at the time it is absolutely needed, but a book like this of Dr. Semple's can be taken up and perused continuously to the profit and instruction of the reader.”

*Indiana Medical Journal,*

Morbid Anatomy.—An excellent compend of the subject from the points of view of Green and Payne.”

*Cincinnati Medical News,*

Morbid Anatomy.—A valuable little volume—truly a *multum in parvo.*”

Specimen of Illustrations.

No. 7.

# ESSENTIALS

OF

# Materia Medica, Therapeutics,

AND

# PRESCRIPTION WRITING.

BY

HENRY MORRIS, M.D.,

Late Demonstrator, Jefferson Medical College; Fellow College of Physicians,  
Philadelphia; Co-editor Biddle's *Materia Medica*; Visiting  
Physician to St. Joseph's Hospital, etc. etc.

---

Second Edition. Crown 8vo., 250 pages.

---

Price, Cloth, \$1.00. Interleaved for Notes, \$1.25.

---

#### MEDICAL AND SURGICAL REPORTER,

"Morris' *Materia Medica* and *Therapeutics*.—One of the best compends in this series. Concise, pithy, and clear, well-suited to the purpose for which it is prepared."

#### GAILLARD'S MEDICAL JOURNAL,

"Morris' *Materia Medica*.—The very essence of *Materia Medica* and *Therapeutics* boiled down and presented in a clear and readable style."

#### SANITARIUM, New York,

"Morris' *Materia Medica*.—A well-arranged quiz-book, comprising the most important recent remedies."

#### BUFFALO MEDICAL AND SURGICAL JOURNAL,

"Morris' *Materia Medica*.—The subjects are treated in such a unique and attractive manner that they cannot fail to impress the mind and instruct in a lasting manner."

Nos. 8 and 9.

# Essentials of Practice of Medicine.

BY HENRY MORRIS, M.D.,

Author of "Essentials of Materia Medica," etc.

With an Appendix on the Clinical and Microscopical  
Examination of Urine.

BY LAWRENCE WOLFF, M.D.,

Author of "Essentials of Medical Chemistry," etc.

---

COLORED (VOGEL) URINE SCALE AND NUMEROUS  
FINE ILLUSTRATIONS.

---

SECOND EDITION,

Enlarged by some THREE HUNDRED Essential  
Formulæ, selected from the writings of the  
most eminent authorities of the  
Medical Profession.

COLLECTED AND ARRANGED BY

WILLIAM M. POWELL, M.D.,

Author of "Essentials of Diseases of Children."

Post 8vo., 460 pages.

---

**Price, Cloth, \$2.00. Medical Sheep, \$2.50.**

---

SOUTHERN PRACTITIONER, Nashville, Tenn.,

"Morris' Practice of Medicine.—Of material aid to the advanced student  
in preparing for his degree, and to the young practitioner in diagnosing affec-  
tions or selecting the proper remedy."

AMERICAN PRACTITIONER AND NEWS, Louisville, Ky.,

"Morris' Practice of Medicine.—The teaching is sound, the presentation  
graphic, matter as full as might be desired, and the style attractive."

SOUTHERN MEDICAL RECORD,

"Morris' Practice of Medicine is presented to the reader in the form of  
Questions and Answers, thereby calling attention to the most important leading  
facts, which is not only desirable, but indispensable to an acquaintance  
with the essentials of medicine. The book is all it pretends to be, and we  
cheerfully recommend it to medical students."

No. 10.

# ESSENTIALS OF GYNÆCOLOGY.

BY

EDWIN B. CRAIGIN, M.D.,

Attending Gynæcologist, Roosevelt Hospital, Out-Patients' Department :  
Assistant Surgeon, New York Cancer Hospital, etc. etc.

SECOND EDITION.

Crown 8vo., 186 pages, 58 fine illustrations.

Price, Cloth, \$1.00. Interleaved for Notes, \$1.25.

*Medical and Surgical Reporter*, April, 1890.—“Craigin's Essentials of Gynæcology.—This is a most excellent addition to this series of question compends, and properly used will be of great assistance to the student in preparing for examination. Dr. Craigin is to be congratulated upon having produced in compact form the Essentials of Gynæcology. The style is concise, and at the same time the sentences are well rounded. This renders the book far more easy to read than most compends, and adds distinctly to its value.”

*College and Clinical Record*, April, 1890.—“Craigin's Gynæcology.—Students and practitioners, general or special, even derive information and benefit from the perusal and study of a carefully written work like this.”

Specimen of Illustrations.

No. 11.

# Essentials of Diseases of the Skin.

BY HENRY W. STELWAGON, M.D.,

Clinical Lecturer on Dermatology in the Jefferson Medical College, Philadelphia; Physician to the Skin Service of the Northern Dispensary; Dermatologist to Philadelphia Hospital; Physician to Skin Department of the Howard Hospital; Clinical Professor on Dermatology in the Women's Medical College, Philadelphia, etc. etc.

## SECOND EDITION.

Crown 8vo., 262 pages, 74 illus. many of which are original.

Price, Cloth, \$1.00. Interleaved for Notes, \$1.25.

Specimen of Illustrations.

New York *Medical Journal.*

Skin.—We are indebted to Philadelphia for another excellent book on Dermatology. The little book now before us is well entitled "Essentials of Dermatology," and admirably answers the purpose for which it is written." The experience of the reviewer has taught him that just such a book is needed. We are pleased with the handsome appearance of the book, with its clear type, good paper, and fine wood-cuts."

"Stelwagon's Diseases of the

No. 12.  
ESSENTIALS

OF  
Minor Surgery, Bandaging, and  
Venereal Diseases.

BY EDWARD MARTIN, A.M., M.D.,  
Author of "Essentials of Surgery," etc.

Crown 8vo., 158 pages, 82 illustrations, mostly specially prepared for this work.

Price, Cloth, \$1.00. Interleaved for Notes, \$1.25.

Specimen of Illustrations.

*Pharmaceutical Era*, Detroit, Michigan,  
Minor Surgery, etc. -Especially acceptable to the general practitioner, who is often at a loss in cases of emergency as to the proper method of applying a bandage to an injured member."

*Medical News*, Philadelphia, 1891.  
"Martin's Minor Surgery, Bandaging, and Venereal Diseases.—The best condensation of the subjects of which it treats yet placed before the profession. The chapter on Genito-Urinary Diseases, though short, is sufficiently complete to make them thoroughly acquainted with the most advanced views on the subject."

*Nashville Journal of Medical and Surgical*,

"Martin's Minor Surgery, etc., should be in the hands of every student, and we shall personally recommend it to our students as the best textbook upon the subject."

"Martin's

No. 13.

ESSENTIALS  
OF  
Legal Medicine, Toxicology,  
AND  
HYGIENE.

BY  
C. E. ARMAND SEMPLE, M.D.,  
Author of "Essentials of Pathology and Morbid Anatomy."

Crown 8vo., 212 pages, 130 illustrations.

---

*Price, Cloth . . . . . \$1.00.  
Interleaved for Notes . . . . . 1.25.*

---

SOUTHERN PRACTITIONER, Nashville,

"Semple's Legal Medicine, etc.—At the present time, when the field of medical science, by reason of rapid progress, becomes so vast, a book which contains the essentials of any branch or department of it, in concise, yet readable form, must of necessity be of value. This little brochure, as its title indicates, covers a portion of medical science that is to a great extent too much neglected by the student, by reason of the vastness of the entire field and the voluminous amount of matter pertaining to what he deems more important departments. The leading points, the essentials, are here summed up systematically and clearly."

MEDICAL BRIEF, St. Louis,

"Semple's Legal Medicine, Toxicology, and Hygiene.—A fair sample of Saunders' valuable compends for the student and practitioner. It is handsomely printed and illustrated, and concise and clear in its teachings."

No. 14.

## ESSENTIALS OF

# Refraction and Diseases of the Eye.

BY EDWARD JACKSON, A.M., M.D.,

Professor of Diseases of the Eye in the Philadelphia Polyclinic and College for Graduates in Medicine; Member of the American Ophthalmological Society; Fellow of the College of Physicians of Philadelphia; Fellow of the American Academy of Medicine, etc. etc.

AND

# Essentials of Diseases of the Nose and Throat.

BY E. BALDWIN GLEASON, M.D..

Surgeon in charge of the Nose, Throat, and Ear Department of the Northern Dispensary; Assistant in the Ear Department of the Philadelphia Polyclinic and College for Graduates in Medicine; Fellow of the American Academy of Medicine; Member of the Polyclinic, the Pathological, and the German Medical Societies, and of the Northern Medical Association of Philadelphia.

Two vols. in one, crown 8vo., 268 pages, profusely illustrated.

Price, Cloth, \$1.00. Interleaved for Notes, \$1.25.

Specimen of Eye Illustrations.

*University Medical Magazine*, Philadelphia,

"Jackson and Gleason's Essentials of Diseases of the Eye, Nose, and Throat. — The subjects have been handled with skill, and the student who acquires all that here lays before him will have much more than a foundation for future work."

*New York Medical Record*,

"Jackson and Gleason on Diseases of the Eye, Nose, and Throat. — A valuable book to the beginner in these branches,

to the student, to the busy practitioner, and as an adjunct to more thorough reading. The authors are capable men, and as successful teachers know what a student most needs."

No. 15.

# ESSENTIALS OF DISEASES OF CHILDREN.

BY

WILLIAM M. POWELL, M.D.,

Attending Physician to the Mercer House for Invalid Women, at Atlantic City, N. J., Late Physician to the Clinic for the Diseases of Children in the Hospital of the University of Pennsylvania and St. Clement's Hospital; Instructor in Physical Diagnosis in the Medical Department of the University of Pennsylvania, and Chief of the Medical Clinic of the Philadelphia Polyclinic.

CROWN 8vo., 216 PAGES.

Price, Cloth, \$1.00 Interleaved for Notes, \$1.25.

AMERICAN PRACTITIONER AND NEWS, Louisville, Ky.,

"Powell's Diseases of Children.—This work is gotten up in the clear and attractive style that characterizes the Saunders' Series. It contains in appropriate form the gist of all the best works in the department to which it relates."

SOUTHERN PRACTITIONER, Nashville, Tennessee,

"Dr. Powell's little book is a marvel of condensation. Handsome binding, good paper, and clear type add to its attractiveness."

ANNALS OF GYNÆCOLOGY, Philadelphia,

"Powell's Diseases of Children.—The book contains a series of important questions and answers, which the student will find of great utility in the examination of children."

No. 16.

# ESSENTIALS OF DIAGNOSIS.

BY

SOLOMON SOLIS COHEN, M.D.,

Professor of Clinical Medicine and Applied Therapeutics in the  
Philadelphia Polyclinic,

AND

AUGUSTUS A. ESHNER, M.D.,

Instructor in Clinical Medicine, Jefferson Medical College, Philadelphia.

POST 8vo.; 382 PAGES.

55 Illustrations, some of which are Colored,  
and a Frontispiece.

---

*Price, \$1.50 net.*

---

MEDICAL RECORD, New York.

"A good book for the student, properly written from their stand-point, and confines itself well to its text."

AMERICAN JOURNAL OF MEDICAL SCIENCES.

"Concise in the treatment of the subject, terse in expression of fact. . . . The work is reliable, and represents the accepted views of clinicians of to-day."

INTERNATIONAL MEDICAL MAGAZINE.

"The subjects are explained in a few well-selected words, and the required ground has been thoroughly gone over."

MEDICAL REVIEW, St. Louis.

"We can heartily recommend this work; it is modern and complete, and will give more satisfaction than many other works which are perhaps too prolix as well as behind the times."

**No. 18.**

**ESSENTIALS**

OF

**PRACTICE OF PHARMACY.**

BY

**LUCIUS E. SAYRE,**

Professor of Pharmacy and Materia Medica in the University of Kansas.

Crown 8vo., 171 pages.

Price, Cloth, \$1.00. Interleaved for Notes, \$1.25.

---

**ALBANY MEDICAL ANNALS**, Albany, N. Y.

"Sayre's Essentials of Pharmacy covers a great deal of ground in small compass. The matter is well digested and arranged. The research questions are a valuable feature of the book."

**AMERICAN DOCTOR**, Richmond, Va.

"Sayre's Essentials of Pharmacy.—This very valuable little manual covers the ground in a most admirable manner. It contains practical pharmacy in a nutshell."

**NATIONAL DRUG REGISTER**, St. Louis, Mo.

"Sayre's Essentials of Pharmacy.—The best quiz on pharmacy we have yet examined."

**WESTERN DRUG RECORD**,

"Sayre's Essentials of Pharmacy.—A book of only 180 pages, but pharmacy in a nut-shell. It is not a quiz-compend compiled to enable a grocery clerk to 'down' a board of pharmacy; it is a finger-post guiding a student to a completer knowledge."

No. 20.

# ESSENTIALS of BACTERIOLOGY.

A

CONCISE AND SYSTEMATIC INTRODUCTION TO THE STUDY  
OF MICRO-ORGANISMS.

BY

M. V. BALL, M.D.,

Assistant in Microscopy, Niagara University, Buffalo, N. Y.; Late Resident Physician German Hospital, Philadelphia, etc.

Crown 8vo., 150 pages.

77 Illustrations, some in Colors.

*Price, Cloth, \$1.00. Interleaved for Notes, \$1.25.*

Specimen of Illustrations.

MEDICAL NEWS, Philadelphia,

"The amount of material condensed in this little book is so great, and so accurate are the formulae and methods, that it will be found useful as a laboratory hand-book."

PACIFIC RECORD OF MEDICINE AND SURGERY, San Francisco,

"Bacteriology is the keynote of future medicine, and every physician who expects success must familiarize himself with a knowledge of Germ-life—the agents of disease."

"This little book with its beautiful illustrations will give the students, in brief, the results of years of study and research, unaided."

No. 21.  
ESSENTIALS OF  
**Nervous Diseases and Insanity,**  
THEIR

*The Hospital*, London,  
England.

"A little work on an important subject, which will prove of great value to medical students and trained nurses who wish to study the scientific as well as the practical points of electricity."

**SECOND EDITION.**

# **HOW TO EXAMINE FOR LIFE INSURANCE.**

**BY JOHN M. KEATING, M.D.,**

Medical Director Penn Mutual Life Insurance Co.; Ex-President of the Association of Life Insurance Medical Directors; Consulting Physician for Diseases of Women at St Agnes' Hospital, Phila.; Gynæcologist to St. Joseph's Hospital, etc.

**With two large Phototype Illustrations, and a Plate prepared by Dr. McClellan from special Dissections; also, numerous cuts to elucidate the text.**

**Price, in Cloth, \$2.00.**

PART I. has been carefully prepared from the best works on physical diagnosis, and is a short and succinct account of the methods used to make examinations; a description of the normal condition, and of the earliest evidences of disease.

PART II. contains the instructions of twenty-four Life Insurance Companies to their medical examiners.

## **PRESS NOTICES.**

"This is the most practical manual on this subject that has yet been offered as a guide to the medical examiner for life insurance. The author has had a large experience as a medical director of one of the great life insurance companies, and it would, therefore, naturally be expected that he would deal with nothing but the useful and indispensable in a work of this kind. Every life insurance examiner should possess this book, even though he may be experienced in this work, for it contains much that is needful in the way of reference that cannot be found grouped elsewhere."—*Buffalo Medical and Surgical Journal*.

"This unpretentious volume, from the pen of one of our most experienced and conservative life insurance medical directors, is just such a book as the young and inexperienced medical examiner needs. It is not a manual of Medical diagnosis, though founded upon the best works of that description. It contains those suggestive hints and recommendations that will be useful to the medical beginner and that can only be furnished by the man of experience."—*The American Journal of the Medical Sciences*.

"This is by far the most useful book which has yet appeared on insurance examination, a subject of growing interest and importance. Not the least valuable portion of the volume is Part II., which consists of instructions issued to their examining physicians by twenty-four representative companies of this country. As the proofs of these instructions were corrected by the directors of the companies, they form the latest instructions obtainable. If for these alone, the book should be at the right hand of every physician interested in this special branch of medical science."—*The Medical News*.

"The volume is replete with information and suggestions, and is a valuable contribution to the literature of the medical department of life underwriters' work."—*The United States Review* (Insurance Journal).

"Naturally, in the prevailing scheme of medical education, special instruction in the peculiar duties of the insurance examiner can have no place. The young physician may be never so good a diagnostician or pathologist, and yet fail to give satisfaction as a medical examiner. The book before us fills this want."—*The University Medical Magazine*.

TRANSACTIONS  
OF THE  
EIGHTH ANNUAL MEETING  
OF THE  
American Climatological Association,  
Held at Washington, D. C.,

September 22, 23, 24, and 25, 1892.

Forming a handsome 8vo. volume of 276 pages,  
uniform with the remainder of the series.

*Price, \$1.50.*

The following Contributions are included in the volume:—

J. H. MUSSER, M.D., Whooping-cough, its Management and Treatment.  
G. M. GARLAND, M.D., Medical Treatment of Pleurisy.  
BEVERLEY ROBINSON, M.D., Catarrhal Inflammations of Upper Air-tract.  
E. L. SHURLEY, M.D., The Sputum in Pulmonary Consumption.  
EDWARD O. OTIS, M.D., Gymnastic Exercise in Chest Diseases.  
ALFRED L. LOOMIS, M.D., Histological Changes in Cured Phthisis.  
S. A. FISK, M.D., Analysis of Cases of Phthisis.

MAURICE H. RICHARDSON, M.D., Acute and Chronic Empyema.  
WALTER A. JAYNE, M.D., Diphtheria at a High Altitude.  
W. W. JOHNSTON, M.D., Chronic Diarrhœa.  
F. H. BOSWORTH, M.D., Lymphatism.

Etc., Etc., Etc.

**NOW READY.**

# **Notes on the Newer Remedies**

THEIR

**THERAPEUTIC APPLICATIONS  
AND MODES OF ADMINISTRATION.**

BY

**DAVID CERNA, M.D., PH.D.,**

Demonstrator of and Lecturer on Experimental Therapeutics in the  
University of Pennsylvania.

**FORMING A SMALL OCTAVO VOLUME OF ABOUT 175  
PAGES (7 x 5) INCHES.**

**PRICE, - \$1.25.**

The work will take up in alphabetical order all the Newer Remedies, giving their physical properties, solubility, therapeutic applications, administration, and chemical formula.

It will, in this way, form a very valuable addition to the various works on Therapeutics now in existence.

Chemists are so multiplying compounds that if each compound is to be thoroughly studied, investigations must be carried far enough to determine the practical importance of the new agents.

Brevity and conciseness compel the omission of all biographical references.

**Now Ready.**

# A MANUAL OF THE PRACTICE OF MEDICINE.

BY

A. A. STEVENS, A.M., M.D.,

Instructor of Physical Diagnosis in the University of Pennsylvania, and  
Demonstrator of Pathology in the Woman's Medical College  
of Philadelphia.

Post 8vo., 502 pages. Illustrated.

**Price, Cloth . . . . . \$2.50**

**W. B. SAUNDERS, Publisher,**

**PHILADELPHIA, PA.**

---

Contributions to the science of medicine have poured in so rapidly during the last quarter of a century, that it is well nigh impossible for the student, with the limited time at his disposal, to master elaborate treatises, or to cull from them that knowledge which is absolutely essential. From an extended experience in teaching, the author has been enabled by classification, the grouping of allied symptoms, and the judicious elimination of theories and redundant explanations to bring within a comparatively small compass a complete outline of the Practice of Medicine.

*Now Ready.*

A MANUAL

OF

MEDICAL JURISPRUDENCE

AND

TOXICOLOGY.

BY

HENRY CHAPMAN, M.D.,

Professor of Institutes of Medicine and Medical Jurisprudence in the Jefferson Medical College of Philadelphia; Member of the College of Physicians of Philadelphia, of the Academy of Natural Sciences of Philadelphia, of the American Philosophical Society, and of the Zoological Society of Philadelphia.

232 pages. Post-octavo.

WITH THIRTY-SIX ILLUSTRATIONS,

Some of which are in Colors.

---

**Price, \$1.25 Net.**

---

For many years there has been a demand from members of the medical and legal professions for a medium-sized work on this most important branch of medicine. The necessarily prescribed limits of the work permit only the consideration of those parts of this extensive subject which the experience of the author as coroner's physician of the city of Philadelphia for a period of six years leads him to regard as the most material for practical purposes.

Particular attention is drawn to the illustrations, many being produced in colors, thus conveying to the layman a far clearer idea of the more intricate cases.
